**Uranium** (û-rá-ni-um), *n.* Sym. U. At. wt. 240; sp. gr. 19.4. A rare metal, whose oxide Klaproth, in 1789, discovered in pitchblende or pechblende and uranite. Peligot first isolated uranium in a pure form in 1840, and determined its atomic weight, at the same time showing that Klaproth's uranium was a protoxide (UO). It was not obtained compact till 1856. The chief source of uranium is pitchblende, which contains nearly 50 per cent of the black oxide and uranite. Metallic uranium is obtained by decomposing its protochloride with potassium or sodium, first in the form of a black powder, or sometimes aggregated on the sides of a crucible in small plates, having a silvery lustre and a certain degree of malleability. By subjecting the metal in either of these forms to further processes it is ultimately obtained in fused globules. In its compact state uranium is somewhat malleable and hard, but is scratched by steel. Its colour is like that of nickel or iron. When exposed to the air it soon tarnishes and assumes a yellow colour. Uranium forms several oxides, which are used in painting on porcelain, yielding a fine orange colour in the enamelling fire, and a black colour in that in which the porcelain itself is baked.

**Uran-mica** (û-ran-mi-ka), *n.* Same as *Uranite*.

**Uran-ochre** (û-ran-ô-kér), *n.* A yellow earthy oxide of uranium, which seems to be derived from the decomposition of the protoxide. In astron. one of the primary

planets, discovered by Sir William Herschel in 1781. It was first called *Georgium Sidus* in honour of George III., afterwards called *Herschel*, in honour of the discoverer. It is the seventh planet in order of distance from the sun. It presents the appearance of a small round uniformly illuminated disc, without rings, belts, or discernible spots. To the naked eye it appears like a star of the sixth magnitude. Its mean distance from the sun is about 1754 millions of miles, and the length of the year 30686 82 days, or about 84 of our years. Its mean diameter is estimated at about 33,000 miles. Its volume exceeds the earth's about 74 times, but as its mean density is only 0.17 (the earth's being 1) its mass is only about 12½ times more. The length of its day is supposed to be between 9 and 10 hours. There is still some uncertainty as to the number of satellites belonging to Uranus. Herschel records six, and two of the four which are seen by astronomers at the present time cannot be identified with any of these. The satellites of Uranus differ from the other planets, primary and secondary (with the exception of Neptune's satellite), in the direction of their motion, which is from east to west, and they move in planes nearly perpendicular to the ecliptic.

It is soluble both in water and alcohol, and, when heated, it melts, gives off much ammonia, and finally solidifies, being in a great measure converted into ammonia and cyanuric acid. Urea is interesting as being the first substance of animal or vegetable origin which chemists succeeded in preparing by artificial means from inorganic constituents.

It occurs in small quantity in the healthy urine of man and quadrupeds, and in much larger quantity in the urine of birds. The semi-fluid excretions of birds and serpents is principally composed of uric acid and urate of ammonia; and guano, which is the decomposed excrement of aquatic birds, is mainly impure uric acid in a remarkable state of decomposition. Uric acid constitutes the principal proportion of the urinary calculi and the concretions causing the complaint known as the gravel. It crystallizes in fine scales of a brilliant white colour and silky lustre; it is inodorous and insipid, heavier than water, and nearly insoluble in it when cold, and only slightly dissolved by it when hot; the solution reddens litmus paper, but feebly. When it is dissolved in nitric acid, and the solution is evaporated and treated with ammonia, a fine purple colour is produced; by this reaction uric acid may be detected.

**Urim** (ü-rim), *n.* [Heb. *urim*, lights or flames, pl. of *ur*, flame.] A kind of ornament or appendage belonging to the habit of the Jewish high-priest in ancient times, along with the Thummim, in virtue of which he gave oracular answers to the people, but what the Urim and Thummim really were has not been satisfactorily ascertained.

Sax. *ury*, dewy, humid, feel *ŭr*, drizzling rain.] An animal fluid or liquor secreted by the kidneys, whence it is conveyed into the bladder by the ureters, and through the urethra discharged. In its natural state it is acid, transparent, of a pale amber or straw colour, a brackish taste, a peculiar odour, and of a specific gravity varying from 1.012 to 1.030. The character of the urine, however, is apt to be altered by a variety of circumstances, and from the variety of the substances extracted from the body through the medium of the kidneys the urinary system may be regarded as the excretory of the entire animal economy, in which we meet with every principle and constituent that analysis has discovered forming the solids and fluids of the body. A knowledge of the urine in health, and of the variations to which it is subject in disease, is of the utmost importance to the medical practitioner, as the different appearances of this fluid indicate not merely the state of the urinary system, but the changes which have taken place in other parts of the animal economy. It varies even in its healthy state according to age, drink, food, medicines, the time of the year, the muscular motion of the body, and the affections of the mind.

The practice of lending money at interest; the practice of taking interest for money lent; or, as the term is now almost exclusively applied, the practice of taking exorbitant or excessive interest; the practice of taking interest in an extortionate way from the needy or extravagant.

Since there must be borrowing and lending, and men are so hard of heart as they will not lend freely, *usury* must be permitted. *Bacon.*

I know of but two definitions that can be possibly given of *usury*: one is the taking of a greater interest than the law allows of; this may be stiled the political or legal definition. **Utilitarian** (ū-til'ī-tā-ri-an), *a.* [From *utility*.] Consisting in or pertaining to utility; pertaining to utilitarianism. See *extract*.

It was in the winter of 1822-23 that I formed the plan of a little society, to be composed of young men agreeing in fundamental principles—acknowledging Utility as their standard in ethics and politics, and a certain number of the principal corollaries drawn from it in the philosophy (Benthamism) I had accepted—and meeting once a fortnight to read essays and discuss questions conformably to the premises thus agreed on. The fact would hardly be worth mentioning, but for the circumstance that the name I gave to the society I had planned was the *Utilitarian Society*. It was the first time that any one had taken the title of *utilitarian*; and the term made its way into the language from this humble source. I did not invent the word, but found it in one of Galt's Novels, *The Annals of the Fens*, in which the Scotch clergyman, of whom the book is a supposed autobiography, is represented as warning his parishioners not to leave the gospel and become *utilitarians*. With a boy's fondness for a name and a banner I seized on the word, and for some years called myself and others by it as a sectarian appellation; and it came to be occasionally used by some others holding the opinions which it was intended to designate. *J. S. Mill.*

**Utilitarian** (ū-til'ī-tā-ri-an), *n.* One who holds the doctrine of utilitarianism.

The *utilitarians* are for merging all the particular virtues into one, and would substitute in their place the greatest usefulness, as the alone principle to which every question respecting the morality of actions should be referred. *Dr. Chalmers.*

S. Mill.*

**Utility** (ū-til'ī-ti), *n.* [*Fr. utilité*, *L. utilitas*, from *utiles*, useful, from *utor*, to use.] The state or quality of being useful; usefulness; the state of being serviceable or conducive to some desirable or valuable end; as, the *utility* of manures upon land; the *utility* of the sciences; the *utility* of medicines.

## V.

**V**, the twenty-second letter of the English alphabet, representing a labial or labiodental consonant sound, produced by the junction of the upper teeth with the lower lip, as in pronouncing *av*, *er*, or *rain*. Its sound (which never varies) is accompanied by the same position of the organs as that required for *f*, but *v* is uttered with voice, and is therefore called sonant, while *f* is surd, or uttered with breath merely. Both *v* and *f* are also continuous consonants, their sound being not checked at once (as in the case of *p*, *t*, &c.), and they also belong to the class of the spirants. As mentioned under *U*, *v* and *u* were formerly the same letter, but they have now as distinct uses as any two letters in the alphabet. The Roman letter *v* consonant was probably pronounced as a *u*: thus *ver*, spring, would be pronounced *uer*; *vespa*, a wasp, *vespa*. This letter did not belong to the Anglo-Saxon alphabet, and its sound is believed to have been represented by *f*, but appears to have occurred only between two vowels (as in *heofon*, heaven). At the beginning of words *f* regularly kept its own sound, and this explains how at the present day scarcely any of the English words that begin with *v* are Teutonic (*vat*, *vane*, and *vizen* are exceptions), though *v* is common enough in the body of words, as in *have*, *leave*, *live*, *heaven*, &c. Almost all English words with initial *v*, therefore, are of Romance origin, the letter having entered our alphabet from the French. The giving of the *v* sound to *f* also illustrates the change of consonant in the plural of such words as *thief*, *thieves*, *wolf*, *wolves*, *life*, *lives*. In the dialect of Southern England *v* commonly takes the place of *f*. In spelling this letter is never final (though its sound often is), nor is it ever doubled. See also *U*.—As a numeral, *V* stands for 5.—In *music*, *V. S.* stands for *volta subito*, turn over (the leaf) quickly.—In *her. V.* is used to express *vert* or *green*, in the tricking or drawing of arms with a pen and ink.

[L. *vaccinus*, pertaining to a cow, from *vacca*, a cow.] To inoculate with the cow-pox by means of vaccine matter or lymph taken directly or indirectly from the cow for the purpose of procuring immunity from small-pox or of mitigating its attack.

**Vaccination** (vak-si-nā'shon), *n.* The act of vaccinating; the art or practice of inoculating persons with the cow-pox, either directly or indirectly, for the purpose of securing them from the contagion of small-pox. The indirect method of vaccination by lymph taken from a pustule caused by previous vaccination in a healthy child is the most common. Dr. Jenner was the first who showed the beneficial effects of vaccination, which, in a great proportion of instances, confers a complete security against small-pox. Even in those cases where the small-pox does occur after vaccination it is generally divested of its more formidable characters. Repeated vaccinations, with intervals of several years, are believed to increase the security. In

England the vaccination of all children, excepting those in an unhealthy or otherwise unfit condition, is compulsory within three months after birth; in Scotland the time extends to six months. See *COW-POX*, also *INOCULATION*.

**Vacciniaceæ** (vak-si-ni-ā'sē-ē), *n. pl.* A nat. order of monopetalous exogens, consisting of shrubby plants, with aqueous juices, round or angled stems and branches, alternate simple leaves, with a solitary or racemose inflorescence, the flowers regular and united; the fruit is a berry, four or five celled, few or many seeded. The species are natives of North America, where they are abundant; in Europe they occur sparingly, but they are not uncommon in mountainous districts. The properties of the order closely resemble those of Ericaceæ, with which, indeed, Vacciniaceæ have much in common, being mainly distinguished by the inferior ovary and epigynous stamens. The bark and leaves of many of the species are astringent, slightly tonic, and stimulating. The berries of many are eaten under the names of cranberry, whortleberry, &c. Several species are elegant garden shrubs, as those belonging to the genus *Gaylussacia*. The typical genus is *Vaccinium*.

bilberries, whortleberries, cranberries, &c. The following are natives of Britain: *V. Myrtillus*, the common bilberry or blueberry; *V. uliginosum*, great bilberry or bog whortleberry; *V. Vitisidæa*, red whortleberry or cowberry; *V. Oxyccoccus*, marsh whortleberry, or cranberry, the berries of which made into tarts are much esteemed. This last, a pretty little trailing bog plant, with slender stems, pink flowers, and bright red berries, is sometimes considered the type of a distinct genus, *Oxyccoccus*. *V. stamineum* and *V. corymbosum*, swamp blueberry, are natives of North America.

**Vacuum** (vak'ü-um), *n. pl. Vacuums* (vak'ü-umz), or sometimes *Vacua* (vak'ü-a). [L. an empty space, a void or vacuity, neut. sing. of *vacuus*, empty; akin *vacant*, *vacation*, &c.] Space empty, or space devoid of all matter or body. Whether there is such a thing as an absolute vacuum in nature is a question which has been much controverted. The existence of a vacuum was maintained by the Pythagoreans, Epi-

cureans, and Atomists; but it was denied by the Peripatetics, who asserted that 'nature abhors a vacuum.' The modern theory, which seems to be warranted by experience, is that an absolute vacuum cannot exist, the subtle medium known as ether being believed to be everywhere present. In a less strict sense a vacuum (more or less perfect) is said to be produced when air is more or less completely removed from an inclosed space, such as the receiver of an air-pump, a portion of a barometric tube, &c. In the receiver of the air-pump the vacuum can only be partial, as the exhaustion is limited by the remaining air not having sufficient elasticity to raise the valves. The Torricellian vacuum, that is, the space above the mercury in a carefully manipulated barometer tube, is more nearly perfect in this respect, but the space is to some extent filled with the vapour of mercury. If, however, an air-pump receiver, filled with pure carbonic acid gas (so as to expel the air), be exhausted, a small vessel containing moist caustic potash, and another containing concentrated sulphuric acid, having been previously introduced, the remaining carbonic acid is taken up and a vacuum produced so nearly absolute that the electric spark fails to pass through it.

**Vacuum-brake** (vak'ü-um-bräk), *n.* A brake operated by steam, used in connection with railway carriages, &c., in which the power employed is the pressure of the atmosphere produced by creating a vacuum.

H. Knight.*

**Vacuum-pan** (vak'ü-um-pan), *n.* A vessel for boiling saccharine juices in a partial vacuum during the process of sugar-making. It is usually spheroidal in shape, and is made in two segmental or semi-globular portions. The vapour from the boiling juice rises into the dome at the top, when it is removed by a pump or condenser. The advantages of this vessel over the old pans are that the quality and quantity of the crystallizable sugar are raised, a smaller proportion of grape-sugar or molasses being produced. *E. H. Knight.*

**Vacuum-pump** (vak'ü-um-pump), *n.* A pump connected with the boiler of a marine steam-engine for pumping out the air and so creating a vacuum, whereupon the seawater flows in from the pressure of the atmosphere.

**Vacuum-tube** (vak'ü-um-tüb), *n.* A tube employed to examine the effects of a discharge of electricity through air or gas rarefied or exhausted to the required degree. The most striking phenomenon is the magnificent coloured light with which the tube is filled, the colour of the light being different at the positive and negative electrodes, and varying with the gas through which the discharge is passed. Thus, in common air it is purple or red at the positive end, blue or violet at the negative; in hydrogen, it is greenish-blue; in carbonic oxide, bright green, turning to yellow at the positive, and to blue at the negative.

**Vadet** (väd), *v.i.* [A form of *fade*. As to change of *f* to *v* see *V.*] 1. To pass away; to vanish; to depart.

It is used in medicine in the form of infusion, decoction, or tincture, as a nervous stimulant and antispasmodic. Besides valerian oil the root contains starch, extractive matter, resin, and valeric acid. *V. rubra*, or red valerian, is occasionally found wild in Britain, and is cultivated in gardens as well as many other species on account of its elegant flowers. *V. metal discovered by Sefström in 1830 in iron prepared from the iron ore of Taberg in Sweden. It was afterwards obtained by the same individual in the slag formed during the conversion of the cast-iron of Taberg into malleable iron. It has since been found in a lead ore from Wanlockhead in Scotland, and in a similar mineral from Zimapan in Mexico, and in the sandstone of Alderley Edge, and Mottram St. Andrew, Cheshire. The metal was first obtained by Roscoe, who showed that the substance generally regarded as vanadium was really an oxide. Vanadium has a strong metallic lustre, considerably resembling silver, but still more like molybdenum. When in mass it is not oxidized either by air or water, but the finely powdered metal quickly takes up oxygen from the air. Oxygen and vanadium combine to form five oxides—viz. a monoxide ( $V_2O$ ), a dioxide ( $V_2O_2$ ), a trioxide ( $V_2O_3$ ), a tetroxide ( $V_2O_4$ ), and a pentoxide ( $V_2O_5$ ).

Goth. *afhrapnan*, to be suffocated.] 1. In *physics*, a term applied to designate the gaseous form which a solid or liquid substance assumes when heated. *Vapour* is, therefore, essentially a gas, and seeing that all known gases have now been proved to be liquefiable, no physical difference can be said really to exist between an ordinary gas, such as oxygen, and a *vapour*, such as steam. In common language, however, a difference is usually recognized: a *gas* is a substance which at ordinary temperatures and pressures exists in a state of *vapour*; while a *vapour* is produced by the application of heat to a substance which normally exists in a solid or liquid form. The difference has been otherwise explained to be one not so much of kind as of degree; steam in the boiler of a steam-engine being said to be in a state of *vapour*, while superheated steam is said to be a *gas*. Aqueous *vapour* formed on the surface of the land and water

is always present in suspension in the atmosphere, and when it meets with a reduction of temperature it condenses into water in the form of rain or dew. See EVAPORATION. 2. In *physics* and *navigation*, the deviation of the magnetic needle, or needle of the mariner's compass, from the true north point; or the angle which the needle makes with the plane of the meridian of a ship or station; called also *Declination*. The variation of the compass does not remain constantly the same in the same place, but undergoes a slow and progressive change. The needle is observed to move gradually towards the west of the true meridian until it arrives at its maximum on that side; it then returns, passes over the true meridian, and moves easterly, until it arrives at its maximum towards the east, when it returns as before. In the year 1576, in London, the variation was 11° 15' east; in 1662, the needle pointed due north, after which time it travelled about 24° to the westward (the maximum being in 1515); it is now considerably less and is continually decreasing. The variation, however, is very different in different parts of the globe, and it is also subject to diurnal changes in the same place. — 7. In *music*, one of a series of ornamental changes or embellishments in the treatment of a tune, movement, or theme during several successive repetitions. The simplest kind of variation is by introducing into the melody a greater or less number of passing notes (that is, notes intermediate in pitch between the original notes of the air), together with cadenzas, scale movements, and the like, or by breaking of the chords into triplets, quadruplets, &c., or throwing them into arpeggio form, the fundamental harmony usually remaining unchanged. In more elaborate styles, however, new harmonies, rhythms, and melodic developments gradually appear, often brilliantly displaying the fertility of the composer's fancy. In many cases variations are mere unmeaning ornaments designed to exhibit the mechanical dexterity of the performer. — *Calculus of variations*, a branch of analysis, the chief object of which is to find what function of a variable will be a maximum or minimum on certain prescribed conditions. This calculus offers the only general, and frequently the only possible, means of solving those problems generally termed *isoperimetrical*. — *SYN*. The hymns, which are upwards of 1000, fall into four divisions (*Vedas* or *Sanhitas*), called respectively *Rig-Veda*, *Yajur-Veda*, *Sama-Veda*, and *Atharva-Veda*, of which the first (see *RIG-VEDA*) is the oldest and the *Atharva-Veda* the latest. Each of these Vedas or *Sanhitas* consists of two parts—the *Sanhita* proper, or a collection of *Mantras* or hymns, consisting of invocations, adoration, thanksgiving, praise, prayer, and the like, and of *Brahmanas*, or commentaries, which have grown round the *Sanhita*, consisting of explanations, mystical and philosophical speculations, legends and illustrations, injunctions in regard to rites and sacrifices, and the like. Varying greatly in age, the Vedas represent many stages of thought and worship, the earliest being the simplest, and the later following and reflecting the development of the Brahmanical system with all its superstitions and rites. Even the most ancient Vedas exhibit a people in an advanced state of civilization. The Vedas had their origin in the wonder with which early man regarded the universe and the operations going on in it. They consist, therefore, largely of highly figurative addresses to the great powers of nature under seemingly individual names, as *Indra* (the Firmament), *Agni* (Fire), *Mitra* (Sunrise), *Varuna* (the Sea), and the like, behind whom, however, a great Being (*Om*) is dimly recognized. Gradually these powers became more and more endowed with personality, and ultimately came to be regarded as real divinities, to whose number more and more were gradually added.

A system of secret tribunals which originated during the middle ages in Westphalia, and then spread over Germany when the regular administration of justice had fallen into complete disorder. The chief of the association (the *Freigraf*, free count) was usually a man of exalted rank, and had the supreme direction of the courts. His associates (*Freisassen* - free justices) concurred in and executed the sentences of the court, being bound by a tremendous oath to obey all its behests, and keep secret its proceedings from all that is between heaven and earth. The assemblies of the tribunal were sometimes held in public and in the open air, but were generally held by night in a forest or in some other concealed place. Any person supposed to be guilty of heresy, sorcery, rape, theft, robbery, or murder, might be summoned before the court and compelled to answer the charge brought against him by the accuser, who was one of the *Freisassen*. If the accused was found guilty of a capital crime, or if he repeatedly refused to appear on being duly cited, it was the duty of the *Freisassen* to put him to death. This system offered great scope for the spirit of private revenge, malice, and interested motives, and many judicial murders were perpetrated. When the governments of the various states became more effective and society more settled, the regular executive struggled to destroy the power of the *vehmerichte*, and ultimately succeeded, the last tribunal being held at Zell in 1568.

**Vein** (ván), *n.* [Fr. *veine*, from L. *vena*, a blood-vessel, vein, also natural bent, genius, supposed to be from same root as *veho*, to carry. See *VEIL*.] 1. One of a system of membranous canals or tubes distributed throughout the bodies of animals for the purpose of returning the impure blood from the extremities, surfaces, and viscera to the heart and lungs. They are devoid of elasticity, and have no pulsation, the motion of the blood being mainly secured by pressure of the moving muscles, between which they are imbedded, the backward flow of the blood being prevented where necessary by a series of valves which permit a current only towards the heart. The veins arise from venous capillaries which collect from the tissues the blood recently brought to them by the arterial capillaries. These venous capillaries unite to form ultimate veins, which still unite in turn, forming gradually larger branches and trunks as they approach the centre of the circulation. The venous blood returned from above the region of the heart is united in one great vein, the vena cava superior, all those from below entering by the vena cava inferior. The portal vein (vena porta) receives the venous blood from the intestines and conveys it through the liver to the vena cava inferior. The pulmonary vein and branches go from the right side of the heart to the lungs, carrying the blood to the air-sacs to be revived by the oxygen of the inspired air. The veins like the arteries are composed of three coats. Valves are absent in the vena porta, the portal, the pulmonary, and various other veins, and are present in greatest numbers in the veins of the extremities. - 2. A tube or an assemblage of tubes through which the sap of plants is transmitted along the leaves. The term is more appropriately applied to the finer and more complex ramifications which interbranch with each other like net-work, the larger and more direct assemblages of vessels being called *ribs* and *neres*. Veins are also found in the calyx and corolla of flowers. - 3. A crack or fissure in a rock, filled up by substances different from the rock, and which may either be metallic or non-metallic. Veins are sometimes many yards wide, having a length of many miles, and they ramify or branch out into innumerable smaller parts, often as slender as threads. Metallic veins are chiefly found in the primary, and lower and middle secondary rocks. Many species of stones, as granite, porphyry, &c., are often found in veins. - 4. A streak or wave of different colour, appearing in wood, in marble, and other stones; a long irregular streak of colour. - 5. A cavity, fissure, or cleft, as in the earth or other substance. One of the older forms of this carriage consisted of two wheels of nearly equal size, placed one before the other, and connected by a beam on which the driver's seat was fixed. The rider, sitting astride the machine, propelled it by the thrust of each foot on the ground. This form dates from the early part of the present century. About half a century later treadles operating cranks on the axle of the front wheel came into use, and soon many modified and improved kinds became popular under the name of the bicycle. (See *BICYCLE*.) A three-wheeled velocipede, or tricycle, which offers a safer seat to its occupant, is also in extensive use, and may be so constructed as to carry two persons. Quickness or speed in motion or movement; swiftness; rapidity; celerity; as, the *velocity* of wind; the *velocity* of a planet or comet in its orbit or course; the *velocity* of a cannon-ball; the *velocity* of light. It is not applied to the movements of animals, or but rarely. See *CELERITY*.—2. In *physics*, rate of motion, whether fast or slow; the rate at which a body changes its position in space; the rate of change of position of a point per unit of time. The *velocity* of a body is *uniform* when it passes

through equal spaces in equal times, and it is *variable* when the spaces passed through in equal times are unequal. The *velocity* of a body is *accelerated* when it passes through a greater space in equal successive portions of time, as is the case of falling bodies under the action of gravity, and it is *retarded* when a less space is passed through in each successive portion of time. When the motion of a body is uniform its *velocity* is measured by the space described by it in a unit of time, as one second. If the motion of the body is not uniform its *velocity* is measured by the space which it would describe uniformly in a given time, if the motion became and continued uniform from that instant of time. The unit of space and time taken in order to measure *velocity*, may be assumed of any magnitude, but in theoretical mechanics one second is usually taken as the unit of time, and one foot as the unit of space.—*Angular velocity*. See under *ANGULAR*.—*Initial velocity*, the rate of movement of a body at starting: especially used of the *velocity* of a projectile as it issues from a firearm.—*Virtual velocity*. *Venal* and licentious scribblers, with just sufficient talents to clothe the thoughts of a pandar in the style of a bellman, were now the favourite writers of the sovereign and the public. *Macaulay.*

—*Venal, Mercenary, Hireling.* Although both *venal* and *mercenary* are used in a bad sense, *venal* is much stronger than *mercenary*, standing to it in the relation of sale to hire. A *venal* man sells himself wholly to his purchaser, sacrificing character, honour, principle, his whole individuality indeed for gain; a *mercenary* man acts with a view to profit in what he does, and is actuated by sordid motives, but he does not necessarily surrender himself unreservedly, or even make any sacrifice of principle. With the mercenary man love of gain is the chief motive; with the *venal* man it is in effect the only motive. *Hireling* denotes that hire is the motive, and thus implies something servile as well as mercenary, conveying more of contempt than of reprobaton.

Thus needy wits a vile revenue made, And verse became a mercenary trade. *Dryden.*

In ventriloquism the sounds are formed by the same organs as the emissions of sound commonly—the larynx or organ of voice, the palate, tongue, &c.—the difference consisting mainly in the mode of respiration. A very full inspiration is taken, which is breathed out slowly and gradually, the sound of the voice being dexterously modified and diminished by the muscles of the larynx and the palate. At the same time the lips of the performer are scarcely moved, and the deception is still further facilitated by the attention of the auditors being directed to the object which is sought to be regarded as the source of the voice. Ventriloquism was known to the ancient Greeks as well as to the Romans.

In England the county in which the trial of a particular cause takes place is said to be the venue of that cause. Originally jurors were summoned from the immediate neighbourhood where a fact happened to try it by their own knowledge, but they are now summonable from the body of the county. A venue is either *transitory* or *local*. It is *transitory* when the cause of action is of a sort that might have happened anywhere, and *local* when it could have happened in one county only. (See *Local Action*, *Transitory Action*, under *LOCAL*, *TRANSITORY*.) By the Judicature Act, 1875, the venue in all cases, civil and criminal, may be regulated by order in council.—To lay a venue, to allege a place.

In myth. the goddess of beauty and love, and more especially of sensual love. Venus was originally the Roman goddess of the spring, but at a comparatively late period she became identified with the Greek *Aphrodite*. She is represented as the highest ideal of female beauty and love, and was naturally a favourite

subject with the ancient poets and artists, some of her statues being among the noblest remains of Greek and Roman sculpture. Among the most famous of her statues are

the Venus of Cnidus, by Praxiteles, of which the Venus de Medici, found in the Villa Hadriana at Tivoli, is supposed to be a free copy, and the Venus of Milo or Melos, found in the island of Melos. Among the modern statues one of the most famous is the Venus of Canova, where she is represented as issuing from the bath.—2. In astron. one of the inferior planets, having its orbit between Mercury and the earth, and the most brilliant of all the planetary bodies. From her alternate appearance in the morning and evening she was called by the ancients *Lucifer* and *Hesperus*, the morning and evening star. The mean distance of Venus from the sun is about 66,134,000 miles; her diameter 7510 miles; and her period of revolution round the sun about 224.7 mean solar days. Her volume is equal to about  $\frac{1}{11}$ ths of the earth, but her density being slightly greater her mass is actually equal to about  $\frac{1}{11}$ ths of the earth. She revolves about an axis, and the time of rotation is about 23<sup>h</sup> 21<sup>m</sup>, the axis of rotation being inclined to the ecliptic at an angle of about 75°. Her greatest angular distance from the sun is from 45° to 47° 12'. According to her various positions relatively to the sun and earth she changes her phases like the moon, appearing full at the superior conjunction, gibbous between that point and the points of her greatest elongation, half-mooned at these points, and crescent-shaped or horned between these and the inferior conjunction. Like Mercury, Venus transits the face of the sun, but at longer intervals. The transits of Venus are of much more importance than those of Mercury, because being nearer to us when in transit her position on the sun is measurably different for observers placed on different parts of the earth. See *TRANSIT*.—3. In old chem. a name given to copper.—4. In her. the green tincture in coat armour when borne by princes; vert.—5. A Linnean genus of lamellibranchiate molluscs, family Veneridae. Speculum*).—*Venus's navel-wort*, a plant of the genus *Omphalodes*, so named from the shape of its seeds, which are round and have a depression in the centre.—*Venus's slipper*. See *CARINARIA*.

**Verb** (vêrb), *n.* [Fr. *verbe*, from L. *verbum*, a word, a verb; from same root as *E. word* (which see).] 1. A word.

That so it might appear, that the assistance of the spirit, promised to the Church, was not a vain thing, or a mere verb. South.

2. In *gram.* that part of speech whose essential function is to predicate or assert something in regard to something else (the subject or thing spoken of); as, the boy *runs*, the man *lifts* the stone, fishes *swim*, he *suffers* much. Verbs have the power of indicating time and mode by means of tenses and moods, but this is not an essential property. They have been divided into *active* and *neuter verbs*, according as they predicate action or state. Active verbs are divided into *intransitive* and *transitive*, according as the action is confined to the actor or passes from him to an object. Intransitive verbs often take an objective of their own nature; as, he *runs* a race; he *sleeps* the sleep of death. When a verb may be used either transitively or intransitively, as, he *walks* the horse, he *walks* to church, the verb in the former use is said to be *causative*. Many causative verbs are distinguished from their corresponding intransitives by a change of form, as *sit, set, lie, lay, fall, fell*. Some verbs are sometimes transitive, sometimes intransitive, and sometimes neuter; as, he *floats* a scheme; John can *float* now; the corpse *floats*. A small class of verbs, as *is, become, exist, was, and grow* (in such phrases as, my hair *becomes* white; he *was* weak; he *grows* old), predicated only existence or transition from one state to another, are called *substantive verbs*, and this name is sometimes restricted to the verb *to be*. *Passive verbs* affirm suffering or endurance of what another does. Hence, only verbs which take an object after them can have a passive voice, because it can be said of objects only that they suffer or endure the action directed on or towards them by the subject of the active verb. Passive verbs are thus the correlatives or complements of active verbs. The infinitive mood, gerund, and supine are properly verbal nouns, implying action or state only without the power of assertion. Participles are adjectives plus the notion of time, and cannot therefore assert.

**Vernier** (vēr-ni-ēr), *n.* [From the inventor, Peter Vernier, of Brussels, who died 1637.] A small movable scale, running parallel with the fixed scale of a sextant, theodolite, barometer, or other graduated instrument, and used for measuring a fractional part of one of the equal divisions on the graduated fixed scale or arc. It consists, in its simplest form, of a small sliding scale, the divisions of which differ from those of the primary scale. A space is taken equal to an exact number of parts of the primary scale, and it is divided into a number of equal parts either greater by 1 or less by 1 than the number that it covers on the primary scale. The diagram represents the vernier of the common barometer for measuring to the hundredth of an inch. The scale *a b* is divided into inches and tenths of inches; the small movable scale *c d* is the *vernier*, and consists of a length of eleven parts of *a b*, divided into ten parts, each part being therefore equal

Fâte, far, fat, fall; mē, met, hér; pine, pin; nôte, not, mōve; tûbe, tub, bull;

oil, pound; ū, Sc. abune; ȝ, Sc. ley.

to one and one-tenth of the divisions upon a b, and the difference between any division on the scale and vernier will be one-hundredth of an inch. In the figure the zero of the vernier is set to the division 30 inches, the division 10 upon the vernier corresponding with that of 28 inches 9 tenths on the scale. Hence, the vernier division 1 is one-hundredth of an inch below the scale division 29 inches 9 tenths; division 2 on the vernier is two-hundredths below 29 inches 8 tenths, and so on. Supposing the vernier were raised any number of hundredths, as two hundredths of an inch, the division 2 would coincide with 29 inches 8 tenths. To read off the hundredths of an inch the vernier zero advances beyond any tenth on the scale; the division that coincides nearest with any on the scale must be taken for the hundredth required. The vernier now usually employed has one graduation more than the corresponding portion of the scale. The principle in both cases is, however, the same.

Vernier.

**Villenage**, **Villeinage** (vil'len-aj), *n.* [See *VILLAIN*.] A tenure of lands and tenements by base services. It was originally founded on the servile state of the occupiers of the soil, who were allowed to hold portions of land at the will of their lord, on condition of performing base and menial services. Where the service was base in its nature, and undefined as to time and amount, the tenure received the name of *pure villenage*, but where the service, although of a base nature, was certain and defined, it was called *privileged villenage*, and sometimes *villein socage*. It frequently happened that lands held in villenage descended in uninterrupted succession from father to son, until at length the occupiers or villeins became entitled, by prescription or custom, to hold their lands against the lord so long as they performed the required services. And although the villeins themselves acquired freedom, or their land came into the possession of freemen, the villein services were still the condition of the tenure, according to the custom of the manor. These customs were preserved and evidenced by the rolls of the several courts-baron, in which they were entered, or kept on foot by the constant immemorial usage of the several manors in which the lands lay. And as such tenants had nothing to show for their estates but the entries into those rolls, or copies of them authenticated by the steward, they at last came to be called *tenants by copy of court-roll*, and their tenure a *copy-hold*.

The disease manifests itself by the development of the fungus over the leaves or shoots as well as over the berries themselves, covering the affected parts with a white powdery-looking net-work of beaded fibres. Growth is soon arrested, and decay or drying up, accompanied with an offensive smell, follows. Sulphur is said to be a reliable remedy. (b) A disease due to the invasion of the parasitic insect *Phylloxera vastatrix*, which, making its first appearance near Avignon in France in 1865, spread over in less than ten years a great part of the richest vine-growing regions of that country, almost entirely destroying the crops in several districts. When the *Phylloxera* attacks a vine the rootlets exhibit peculiar swellings, and the insects multiply so rapidly as soon to overrun all the roots, and by absorbing nourishment from the plant reduce it to a totally exhausted state. No certain remedy has as yet been discovered against this evil. Many other fungous and insect parasites attack the vine, but with far less destructive effects.

Vinegar may also be obtained from strong beer, by the fermentation of various fruits, or of a solution of sugar mixed with yeast; in short, all liquids which are capable of the vinous fermentation may be made to produce vinegar. 120 parts of water, 12 of brandy, 3 of brown sugar, 1 of tartar, and  $\frac{1}{2}$  of sour dough, if left for some weeks in a warm place, yield a strong and pleasant vinegar. All the above vinegars yield by distillation a purer and somewhat weaker acetic acid, called *distilled vinegar*. — *Radical vinegar*, a more concentrated solution of acetic acid, obtained by distilling 3 parts of dry powdered acetate of soda with 97 of oil of vitriol, as pure and concentrated as possible. This vinegar, holding camphor and essential oils in solution, constitutes the *aromatic vinegar* of the shops. — *Wood vinegar*, an impure acetic acid obtained by the distillation of wood: called also *Pyroligneous Acid*. L. *vitula*, *vidula*, a viol or similar stringed instrument. *Diez* takes the word from L. *vitulari*, to be joyful, to celebrate a festival. *Fiddle* may have the same origin. See FIDDLE.] An ancient musical instrument of much the same form as the violin, but having the belly and back flat, and with larger bends in the sides than that instrument. It may be considered as the parent of our modern instruments of the violin kind. The viol was a stringed instrument with frets, and played on by a bow. There were three sorts, treble, tenor, and bass, each having from three to six strings, which were tuned in fourths and thirds.

Viol da gamba.—From Harleian MS.

The *treble viol* was somewhat larger than our violin, and the music for it was written in the treble clef. The *tenor viol* was about the same length and breadth as the modern tenor violin, but thicker in the body, and the music for it was in the mean or C clef. The dimensions of the *bass viol* were much the same as those of the violoncello, and the music for it was written in the bass clef. The smaller viols were called *viol da braccio*, from being held by the arm; the larger, *viol da gamba*, from being placed between the legs. The viol da gamba held its place longer than the smaller viols, but at last gave way to the violoncello.—*Viol d'amore*, an obsolete instrument of the violin family. In addition to five or seven catgut strings,

the same number of metal strings, tuned in unison, were placed under the finger-board, which, by the production of sympathetic sound, gave a peculiar quality of tone to the instrument.—*Viola pomposa*, a species of *viol da gamba*, invented by Bach, having five strings, the four lower of which were tuned like the violoncello in fifths, and the fifth string was tuned to E.

**Viola** (vi'ō-lā), *n.* [It.] A large kind of violin, to which the part between the second violin and the bass is generally assigned. The violets are favourite flowers in all northern and temperate climates, and many of them are among the first to make their appearance in the spring. The greatest favourites are the varieties of the *V. odorata*, or common sweet violet, and of *V. tricolor*, the pansy, or heart's-ease, *V. odorata* being especially esteemed for its fragrance and early appearance. The roots of several species of *Viola* were formerly used in medicine. They contain a bitter alkaloid (*violilin*, which see), which acts as an emetic and purgative.

The order is divided into two tribes, *Violeæ* and *Alsodineæ*. *Violeæ* chiefly consist of European, Siberian, and American plants; *Alsodineæ* are South American and African plants. The roots of all the *Violaceæ* appear to be more or less emetic, a property which is strongly possessed by the South American species.

See **VIOL**.] A well-known stringed musical instrument, consisting of four catgut strings, the lowest of which is covered with silvered copper wire, stretched by means of a bridge over a hollow wooden body, and played with a bow; a fiddle. It is considered the most perfect of musical instruments, on account of its capabilities of fine tone and expression, and of producing all the tones in any scale in perfect tune. It forms with its cognates, the viola, violoncello, and double-bass, the main element of all orchestras. The principal parts of the violin are the *scroll* or *head*, in which are placed the pins for tuning the strings; the *neck*, which connects the scroll with the body, and to which is attached the *finger-board*, upon which the strings are stopped by the fingers of the left hand as it holds the neck in playing; the *belly*, over which the strings are stretched, and which has two f-shaped sound holes, one on each side; the *back* or *under side*; the *sides* or *ribs*, uniting the back and belly; the *tail-piece*, to which the strings are fastened; and the *bridge*. The four strings of the violin are tuned at intervals of fifths, G, on the upper space of the bass staff, D, A, E reckoning upwards. Every intermediate semitone in its ordinary compass of 3½ octaves may be produced by stopping the strings, and the compass may be almost indefinitely extended upwards by the harmonics produced by touching the strings lightly. The violin can, to a limited extent, be made to produce harmony by sounding two or three strings together. Instruments of the violin kind are of great antiquity.

Its ordinary compass from C on the second ledger-line below extends to A on the second space of the treble, but soloists frequently play an octave higher.

The principle of *virtual velocities* may be thus enunciated: "If any system of bodies or material points, urged each by any forces whatever, be in equilibrium, and there be given to the system any small motion, by virtue of which each point describes an infinitely small space, which space will represent the *virtual velocity* of the point; then the sum of the forces, multiplied each by the space which the point to which it is applied describes in the direction of that force, will be always equal to zero or nothing, regarding as positive the small spaces described in the direction of the forces, and as negative those described in the opposite direction." ciple is easily verified by experiment with respect to the six mechanical powers, but it applies immediately and most evidently to all questions respecting equilibrium or static problems, and it furnishes a very easy method of ascertaining the power of any machine, or the proportion between two forces which would balance one another. For according to this principle the power multiplied by the space through which it moves in the vertical direction must always be equal to the weight multiplied by the space through which it moves in the vertical direction.

The species, which are found chiefly in Asia and America, are climbing shrubs, with simple lobed, cut, or toothed, rarely compound leaves, and thyrsoid racemes of small greenish yellow flowers, and bearing in clusters a fruit called grapes. The best known, and by far the most important species, is the *V. vinifera*, the common vine or grapevine, a native of Central Asia, of which there is a multitude of varieties. The cultivation of the vine extends from near 55° north latitude to the equator, but in south latitudes it only extends to about 40°. It is rarely grown at a greater altitude than 3000 feet. In favourable seasons the vine ripens in the open air in England, and in the eleventh and twelfth centuries considerable quantities of inferior wine were made from native grapes. Vineyards are now, however, unknown in this country; but the grapes raised in hothouses are excellent. The vine grows in every sort of soil; but that which is light and gravelly seems best suited for the production of fine wines. The vine is a long-lived plant; indeed, in warm climates, the period of its existence is not known. It is propagated from seeds, layers, cuttings, grafting, and by inoculation. Several species of vine are indigenous in North America, as the *Vitis Labrusca*, the wild-vine or fox-grape; *V. cordifolia*, heart-leaved vine or chicken-grape; *V. riparia*, river-side or sweet-scented vine. See WINE.

**Voice** as a scientific term may mean either the faculty of uttering audible sounds, or the body of audible sounds produced by the organs of respiration, especially the larynx of men and other animals; contradistinguished from *speech* or *articulate language*. Voice is produced when air is driven by the muscles of expiration from the lungs through the trachea and strikes against the two vocal chords (see under **VOCAL**), the vibrations of which produce sounds varying in different animals according to the structure of the organs and the power which the animal possesses over them. Voice can, therefore, only be found in animals in which the system of respiration is developed, and the lungs and larynx actually exist. Fishes having no lungs are dumb. In man the superior organization and mobility of the tongue and lips, as well as the perfection of the larynx, enable him to modify his vocal sounds to an almost infinite extent. In ordinary speaking the notes of the voice have nearly all the same pitch, and the variety of the sounds is due rather to articulation in the mouth than to definite movements of the glottis and vocal chords. In singing the successive sounds have vibrations corresponding in relative proportions to the notes of the musical scale. The male voice admits of division into tenor and bass, and the female into soprano and contralto. The lowest female note is an octave or so higher than the lowest note of the male voice; and the female's highest note is about an octave above that of the male. The compass of both voices taken together is about four octaves, the chief differences residing in the pitch and also in the timbre. 2. The faculty of speaking; as, to lose one's voice.—3. 9. In *phonetics*, sound uttered with resonance of the vocal chords, and not with a mere emission of breath; sonant utterance.

All consonants are really checks, and their character consists in their producing for a time a complete cessation of audible breath or voice. The caterpillar towards the end of summer waxeth *volatile*, and turneth to a butterfly. *Bacon.*

2. Having the quality of passing off by spontaneous evaporation; evaporating rapidly; diffusing more or less freely in the atmosphere. Substances which affect the smell with pungent or fragrant odours, as musk, hartshorn, and essential oils, are called *volatile* substances because they waste away on exposure to the atmosphere. Alcohol and ether are called *volatile* liquids for a similar reason, and because they easily pass into the state of vapour on the application of heat. On the contrary gold is a *fixed* substance because it does not suffer waste, even when exposed to the heat of a furnace; and oils are called *fixed* when they do not evaporate on simple exposure to the atmosphere. See OIL. — 3. Lively; brisk; gay; full of spirit; airy; hence, fickle; apt to change; as, a *volatile* temper.

By the spirit of a plant we understand that pure elaborated oil, which, by reason of its extreme *volatility*, exhales spontaneously, and in which the colour or smell consists. *Arbutnot.*

Their surfaces are rough, fissured with branching cracks; their internal structure is either irregularly scoriaceous and compact, or it presents a symmetrical and very curious appearance, which is simply explained if we suppose a mass of viscid, scoriaceous matter to be projected with a rapid rotary motion through the air. *Darwin.* — *Volcanic foci*, subterranean centres of igneous action, from which minor exhibitions diverge. *Page.* — *Volcanic glass*, vitreous lava; obsidian (which see). — *Volcanic mud*, the fetid sulphureous mud discharged by volcanoes, especially those of South America. *Page.* — *Volcanic rocks*, rocks which have been formed by volcanic agency; all igneous productions of recent or modern origin, as distinct from the trappean and granitic series.

Skr. *ulka*, fire.] A hill or mountain more or less perfectly cone-shaped, with a circular cup-like opening or basin (called a *crater*) at its summit; popularly termed a *burning mountain*. In the centre of the crater is the mouth of a perpendicular shaft, which sends out clouds of hot vapour, gases, and, at times of increased activity, showers of ashes, hot fragments of rocks, and streams of fiery liquid rocks, called *lava*, which flow down the slopes of the mountain. The gradual accumulation of these ejected materials*

Section of an active Volcano.

around the crater forms a succession of concentric layers which explains the conical shape. The mountain has often several subsidiary cones connected with the principal, and lava may flow out from various mouths or vents. The flames described as issuing from the crater are usually the reflection of the glowing lava illuminating the clouds of vapour, scoria, and ashes. Nearly all active volcanoes have times of relative repose, interrupted, often at great intervals, by periods of increased activity, which terminate in a violent ejection of incandescent matter from the interior. The volcano is then said to be in a state of eruption, which is usually foreboded by loud subterranean noises, like explosions of distant artillery, shocks of earthquake, &c. The most important European volcanoes are Vesuvius, near Naples, whose sudden eruption in 79 A.D. overwhelmed Pompeii, Herculaneum, and other cities; Etna, in the island of Sicily; and Hecla in Iceland.

A volcano has been described by Sir Charles Lyell as 'a more or less perfectly conical hill or mountain, formed by the successive accumulations of ejected matter in a state of incandescence or high heat, and having one or more channels of communication with the interior of the earth, by which the ejections are effected.' *Page.*

**Vole** (vôl), *n.* [Also called *vole-mouse*, perhaps for *vold-mouse*, *vold*, field, plain, so that the name would be equivalent to field-mouse; comp. O. Southern E. *volde*, field, earth; Icel. *vollr*, field.] A name common to the members of a widely spread genus (*Arvicola*) of rodent animals, resembling, and in many cases popularly bearing the names of rats and mice, and belonging to a group (*Arvicolidae*) which some naturalists regard as a distinct family, others as a sub-family of the Muridae. Some are terrestrial, others aquatic. The common vole (*A. agrestis*), the meadow-mouse or short-tailed field-mouse, is injurious to young plantations, devouring the bark and destroying the roots. The water-vole or water-rat (*A. amphibius*) is much larger, and swims well though its feet are not webbed. A black variety of the water-vole common in Britain is the *A. atra*. There are many other species in the Old and New Worlds. See ARVICOLA.

'Will' is an ambiguous word, being sometimes put for the 'faculty' of willing; sometimes for the 'act' of that faculty, besides other meanings. But *volition* always signifies the 'act of willing,' and nothing else. Willingness, I think, is opposed to unwillingness or aversion. A man is willing to do what he has no aversion to do, or what he has some desire to do, though perhaps he has not the opportunity; and I think this is never called *volition*. *Red.*

**Voltaism** (vol'tā-izm), *n.* That branch of electrical science which has its source in the chemical action between metals and different liquids. It is so named from the Italian philosopher *Volta*, whose experiments contributed greatly to the establishment of this branch of science. A very simple *volumenometer* consists of a globular flask with a narrow neck, about 12 inches long, and graduated from below upwards to indicate grains of water. The flask has a tubulure, accurately fitted with a ground stopper, for admitting the solid body to be measured. The instrument being filled to the mark 0° on the neck with a liquid, as water, which does not act upon the solid, it is inclined on one side, the stopper removed, and the solid body introduced. In 1794, and again in 1803, when the ambition and threats of France agitated England, the government reckoned upon having a force of half a million efficient volunteers in arms; but by 1815 this force almost ceased to exist. About 1857 a feeling of insecurity began to manifest itself in consequence of the alleged insufficiency of the national defences, and several volunteer corps were formed. In the course of two or three years many thousands of volunteer riflemen were enrolled throughout the kingdom. Corps of artil-

lerymen, engineers, &c., were subsequently formed. These bodies of men the British government provides with competent instructors, arms, and a part of their ammunition, besides allowing to each corps certain grants calculated on the number of the efficient members, &c. **Vowel** (vou-el), *n.* [Fr. *royelle*, from L. *vo-calis*, lit. a vocal letter, from *vox*, *vo-cis*, the voice. See *VOICE*.] 1. A sound uttered by simply opening the mouth or vocal organs; a sound uttered when the vocal organs are merely in an open position, as the sound of a or o. Vowels are distinguished from consonants in that the former can be pronounced by themselves, while consonants require to be sounded with the aid of a vowel.

When the voice is not further modified by contact, partial or complete, of the lips or tongue, but flows through an open channel without any friction or hissing, then we have *vowel* sound. When on the other hand the sound is not complete until the action of some part of the organs of the mouth has ceased,

then we have produced what we may call *consonantal* sound. Briefly, a *vowel* is the result of an open position of the oral organs; an articulation (this is Mr. Bell's term for *consonant*) is the result of an opening action of the organ.

*Vowels* in all their varieties are really infinite in number. Yet, for practical purposes, certain typical *vowels*, each with a large margin for dialectic variety, have been fixed upon in all languages. *Max Müller.*

The Roman poets transferred all the stories which are related of the Greek Hephaestus to their own Vulcan, the two divinities becoming in the course of time completely identified. By some writers he is said to have been born lame, but by others his lameness is attributed to his having been thrown from Olympus. Vulcan patronized handicraftsmen of every kind,

**Vulcanite** (vul-kan-it), *n.* 1. A kind of vulcanized caoutchouc differing from ordinary vulcanized caoutchouc in containing a larger proportion of sulphur—from 30 to 60 per cent—and in being made at a higher temperature. It is of a brownish-black colour, is hard and tough, cuts easily, and takes a good polish, on which account it is largely used for making into combs, brooches, bracelets, and many other ornaments. It is not affected by water or any of the other caoutchouc solvents. As it is especially distinguished by the large quantity of electricity which it evolves when rubbed, it is much used in the construction of electric machines. Called also *Ebonite*.—2. A name sometimes given to volcanic garnet or pyroxene, from its being found in ejected blocks and lavas.

**Vulcanization** (vul-kan-iz-ā'shon), *n.* A method of treating caoutchouc or india-rubber with some form of sulphur to effect certain changes in its properties, and yield a soft (*vulcanized india-rubber*) or a hard (*vulcanite*) product. This was originally effected by dipping the rubber in melted sulphur and heating it to nearly 300°. Several other methods have been employed, probably the best of which for general purposes consists in mechanically mixing the rubber at a moderate heat with flowers of sulphur, and subsequently 'curing' it in superheated steam at from 250° to 300° Fahr. Other ingredients, as litharge, white-lead, zinc-white, whiting, &c., are added to the sulphur to give colour, softness, &c., to the rubber. The substance thus formed possesses the following properties: it remains elastic at all temperatures; it cannot be dissolved by the ordinary solvents, neither is it affected by heat within a considerable range of temperature; finally, it acquires extraordinary powers of resisting compression, with a great increase of strength and elasticity. Vulcanized india-rubber is employed with great success for very many useful purposes: for waterproofing cloth, for boots, shoes, mats, toys, belting, buffers, wheel-tires, washers, valves, pipes, fire-hose, medical and surgical appliances, &c. Hard vulcanized rubber is known as *ebonite* or *vulcanite*. See *VULCANITE*.

dead carcasses and offal. Their geographical distribution is confined chiefly to warm countries, where they act as scavengers to purify the earth from the putrid carcasses with which it would otherwise be encum-

bered. The Vulturidæ are divided into several genera, the chief being Vultur, Cathartes, Sarcorhamphus, Neophron, and Gypætos, of which the last approaches to the Falconidæ in its characters and habits, having the head feathered and not always feeding on carrion, but often attacking living animals. The griffon vulture (*V. fulvus*) inhabits the mountainous parts of the south of Europe, Silesia, Spain, the Alps, the Pyrenees, Turkey, and the Grecian Archipelago. The cinereous or brown vulture (*V. cinereus*) inhabits lofty mountains in Europe, and the forests of Hungary, the Tyrol, and the Pyrenees, the south of Spain and Italy. ## W.

**W** is the twenty-third letter of the English alphabet. It takes its form and its name from the union of two V's, the character V having formerly the name and force of U. (See **V** and **U**.) The name, double u, however, being given to the letter from its form or composition, and not from its sound, is not a very suitable one. In the Anglo-Saxon alphabet it had a character with a distinctive form of its own, the more modern letter being adopted in the thirteenth century. This letter is used to represent two sounds, the one which distinctively belongs to it being that which it has at the beginning of a syllable and followed by a vowel, as in *wave, will, dwell, away, forward*, &c. This sound has somewhat the character of a vowel, and *w* in such a position is hence often spoken of as a semi-vowel. It is formed by opening the mouth with a close circular configuration of the lips, the organs having exactly the position they have in pronouncing the *oo* of *foot*. Yet it has not really a vowel sound in such cases, and *well*, for instance, is not equivalent to *oo-ell*. This fact is more conclusively shown by such words as *wood, wool, woman*, in which the *oo*-sound is distinctly preceded by a consonant. Its true character is also shown by the definitions given by the best modern phonologists for a consonant and a vowel. Thus, Mr. Melville Bell defines a vowel as the result of an open position of the oral organs; an articulation (or consonant) as the result of an opening action of the organs. It is this opening action that marks *w* as distinct from *oo*, yet pronounced in a drawling manner it is hardly different in force. At the end of syllables, in which position it is always preceded by a vowel, it has either no force at all (or at most lengthens the vowel), as in *law, lawful, to sow, low, hollow*, &c., or it forms the second element in a diphthong, as in *now, row, new, few*, being then really a vowel, and equivalent to the *u* in *neutral, bough*, &c. Followed by *r* it is initial in a considerable number of English words, as *wrap, write, wrong*, &c. It is now silent in such positions, though it was long sounded, as it still is in Scotland. *Wh* is another initial combination, as in *what, where, whale, whet*, &c. In Anglo-Saxon these words were spelt with *hw* (which in cognate words represents Icel. *h*, *L. qu* initial), there being a guttural sound originally heard before the *w*. In Scotland, in such words as *what, whale*, a very decided guttural is heard before *w*. With the best speakers of modern English, however, *wh* seems to be *w* with a slight aspiration after it, though there is a tendency to pronounce *w* pure and simple. In Anglo-Saxon *wh* was also an initial sound; thus *lisp* was originally *wlisp*, the *w* having

disappeared. It has also disappeared from *tree, knee, four, ooze, such, sister*, &c.; and, as above mentioned, it is not heard in many words, to which may be added such as *sword, two, answer, gunwale*, &c. In many words it has taken the place of an older *g*, as in *laine, maw*, &c. (See **G**.) It has intruded itself into *whole, whore*. A *w* coming before a *o* often has the effect of giving the latter an *o*-sound (comp. *wad, wallow, water*, &c.); *qu* (= *kw*) has the same effect.—As an abbreviation *W* stands for west; *W.N.W.* for west-north-west; *W.S.W.* for west-south-west, &c.

'Now the English bottoms have *waft* us o'er.' *John*, ii. 1. 'And *waft* her love to come again.' *Merch.* v. 1.] 1. (be) *wegen*, to move; O. and Prov. G. *wagen*, to shake, to move; Goth. *vigan*, *vagian*, to move, to shake; akin to *wagon*, *weigh*, *way*, *wave*.] To cause to move up and down, backwards and forwards, or from side to side alternately, as a small body jointed, attached, or connected with a larger one; to move one way and another, as on a pivot, joint, or on or from something by which the body is supported; to cause to shake, oscillate, or vibrate slightly.

The least light motion, but it is a sin. *Dryden.*

Sc. *hempie*, a gallow, a frolicsome person, a wag, lit. one fitted for the hempen pole.] A person who is fond of a joke or of making jokes; one who is full of merry frolicsome tricks or pranks; one full of sport and humour; a humorist; a droll fellow; a wit; a joker. The word seems formerly to have been applied to a person who indulged in coarse, low, or broad humour, or buffoonery, such as the practical joker, &c.

We wink at *wags*, when they offend. *Dryden.*

A *wag* is the last order even of pretenders to wit and good humour. He has generally his mind prepared to receive some occasion of merriment, but is of himself too empty to draw out any of his own set of thoughts; and therefore laughs at the next thing he meets, not because it is ridiculous, but because he is under a necessity of laughing. *Steele.*

Something deposited, laid, or hazarded on the event of a contest or some unsettled question; something staked by each of two parties in support of his own opinion concerning a future or an unknown event; a stake. The party whose opinion proves to be correct receives what has been staked by both. By statutes of England, Scotland, and the United States, all contracts or agreements, whether by parole or in writing, depending on wagers, are null and void, and the wager or money due thereon cannot be recovered in any court of law. A wager is therefore merely a debt of honour, and if paid it is in the eye of the law the same thing as giving a gratuity.

Besides these plates for horse races, the *wagers* may be as the persons please. *Sir H. Temple.*

For most men (till by losing rendered sager)  
Will back their own opinion by a *wager*. *Byron.*

In *law*, an offer to make oath of innocence or non-indebtedness; or the act of making oath, together with the oaths of eleven compurgators, to fortify the defendant's oath. — *Wager of battle or battle.* See under **BATTLE**. — *Wager of law* was formerly a mode of trial, whereby in an action of debt brought upon a simple contract between the parties, without any deed or record, the defendant might discharge himself by taking an oath that he owed not the plaintiff anything; but he required to bring with him eleven persons of his neighbours, called *compurgators*, who were to avow upon their oath that they believed in their consciences that he declared the truth. — *Wager policy.* See under **WAGERING**.

*Swift.*

**Wagering** (wā'jér-ing), *p.* and *a.* Pertaining to wagers; betting. — *Wagering policy, or wager policy*, a policy of insurance insuring a sum of money when no property is at hazard, as a policy to insure money on a ship when no property is on board. Such policies are generally held to be null and void.

Thou thy worldly task hast done,

Home art gone, and ta'en thy *wages*. *Shak.*

*Wages*, then, depend mainly upon the demand and supply of labour.

*J. S. Mill.*

**Note.** In ordinary language the term *wages* is usually restricted to the remuneration for mechanical or muscular labour, especially to that which is ordinarily paid at short intervals, as weekly or fortnightly, to workmen. Correctly speaking, however, what is called the *fees* of professional men, as lawyers, physicians, &c., the *salaries* of public functionaries, business men, &c., the *pay* of military and naval men, and the like, are all *wages*. On the other hand, when an author publishes a book, or a shoemaker sells a pair of shoes, the sums received are not *wages*, though to the seller they are virtually the same thing.

**Waget**, *n.* Probably the same as *Watchet*, a light-blue colour, or a cloth of such a colour. The word is Chaucer's: 'A kirtle of a light *waget*.'

**Wagon, Waggon** (wā'gón), *n.* [A. Sax. *wagen*, *wagun*, *wægn*, which in later times became *wain*; D. and G. *wagen*, Icel. and Sw. *wagn*, Dan. *rogn*; lit. a carriage, what carries, from root seen in A. Sax. *wegan*, Icel. *wega*, to carry; cog. Skr. *rah*, L. *reho*, to carry (whence *vehicle*).] Akin also to *way*, *wag*, *weigh*, &c. Skeat remarks that *wagon* cannot come directly from the A. Sax. *wain* being the word that has directly descended from it (with some change of form as in *rain*, *hail*, *naul*, &c.). He therefore regards *wagon* as borrowed from the Dutch in the fifteenth or sixteenth century. Yet it seems strange that with *wain* in common usage we should have borrowed another word of the same signification. 1. A four-wheeled vehicle for the transport of heavy loads. The English wagon is usually a strong heavy machine drawn by two horses yoked abreast. The fore wheels are much smaller than the hind pair, and their axle is swivelled to the body of the wagon to facilitate turning. The bodies of most wagons are set on springs on account of the weight of the vehicle and the absence of the steady power of the horse, who expends his force in pulling only, the weight being distributed over the four wheels. Common varieties of the wagon are the brewer's dray, the railway lorry, and the agricultural wain. Wagons, such as are used by carriers, are frequently provided with wooden bows, over which a covering of heavy canvas or the like may be stretched to protect their contents from rain. The ends of the bows are inserted in staples on each side of the vehicle, so that tilt and bows can be readily removed when not required. In the United States wagons of a much lighter build, and drawn by one horse only, are much used for the conveyance of passengers and light commodities. — 2. An open four-wheeled vehicle for the conveyance of goods on railways. 3. A chariot. 'Her *waggon* spokes made of long spinners' legs.' *Shak.*

Now fair Phœbus 'gan decline in haste,  
His weary *waggon* to the western vale. *Spenser.*

**Wagon** (wā'gón), *v. t.* To transport, convey, or carry in a wagon; as, to *wagon* goods from the country to the metropolis.

**Wagon-boller** (wā'gón-boil-ér), *n.* A kind of steam-boller, having originally a semi-cylindrical top, the ends and sides vertical, and the bottom flat, thus having the shape of a wagon covered with its tilt. Improved forms have the sides and bottom slightly curved inwardly.

trouble; akin to Mod. G. *wirren*, to embroil, confuse; D. *war*, entanglement, confusion, *warren*, to disturb, to embroil. Supposed to be connected with *wearse*, through the sense of entanglement or confusion.] 1. A contest between nations or states (*international war*), or between parties in the same state (*civil war*), carried on by force of arms, usually arising, in the first case, from disputes about territorial possessions and frontiers, unjust dealings with the subjects of one state by another, questions of race and sentiment, jealousy of military prestige, or mere lust of conquest, rarely nowadays from the whim of a despot; in the second case, from the claims of rival contenders for supreme power in the state, or for the establishment of some important point connected with civil or religious liberty. In all cases the aim of each contending party is to overthrow or weaken the enemy by the defeat or dispersion of his army or navy, the occupation of important parts of his country, such as the capital or principal administrative and commercial centres, or the ruin of his commerce, thus cutting off his sources of recuperation in men, money, and material. International or public war is always understood to be authorized by the monarch or sovereign power of the nations; when it is carried into the territories of a hitherto friendly power it is called an *aggressive* or *offensive war*, and when carried on to resist such aggression it is called *defensive*. Previous to the outbreak of hostilities between states, the power taking the initiatory step issues a *declaration of war*, which now usually takes the form of an explanatory manifesto addressed to neutral governments. During the progress of the struggle certain *laws, usages, or rights of war* have come to be generally recognized; such laws permitting the destruction or capture of armed enemies, the destruction of property likely to be serviceable to them, the stoppage of all their channels of traffic, and the appropriation of everything in an enemy's country necessary for the support and subsistence of the invading army. On the other hand, though an enemy may be starved into surrender, wounding, except in battle, mutilation, and all cruel and wanton devastation, are contrary to the usages of war, as are also bombarding an unprotected town, the use of poison in any way, and torture to extort information from an enemy; and generally the tendency in all laws and usages of war is becoming gradually more favourable to the cause of humanity at large. — 2. Instruments of war. 'His compliment of stores, and total war.' *Prior*. [Poetical.] — 3. Forces; army. [Poetical.]

O'er the embattled ranks the waves return  
And overwhelm their war. *Milton.*

varied sizes, according to the number of the society by which they are inhabited. With armed *watch*, that render all access  
Impregnable. *Milton.*

5. The period of time during which one person or body of persons watch or stand sentinel, or the time from one relief of sentinels to another; hence, a division of the night, when the precautionary setting of a watch is most generally necessary. The Jews, like the Greeks and Romans, divided the night into military watches instead of hours, each watch representing the period for which each separate body of sentinels remained on duty. The proper Jewish reckoning recognized only three such watches: the first (lasting from sunset till about 10 P. M.), the second or 'middle watch' (10 P. M. to 2 A. M.), and the third, or 'morning watch' (from 2 A. M. till sunrise). After the establishment of the Roman power they were increased to four, which were named according to their numerical order, as first, second, &c., or by the terms *even*, *midnight*, *cock-crowing*, and *morning*, these terminating respectively at 9 P. M., midnight, 3 A. M., and 6 A. M. See Ex. xiv. 24; Judg. vii. 19; Lam. ii. 19; and Mat. xiv. 25; Mark xiii. 35.

6. *Naut.* (a) the period of time occupied by each part of a ship's crew alternately while on duty. The period of time called a *watch* is four hours, the reckoning beginning at noon or midnight. Between 4 and 8 P. M., the time is divided into two short or *dog-watches* in order to prevent the constant recurrence of the same portion of the crew keeping the watch during the same hours. Thus, the period from 12 to 4 P. M. is called the *afternoon watch*, from 4 to 6 the first *dog-watch*, from 6 to 8 the second *dog-watch*, from 8 to 12 the *first night watch*, from 12 to 4 A. M. the *middle watch*, from 4 to 8 the *morning watch*, and from 8 to 12 noon the *forenoon watch*. When this alternation of watches is kept up during the 24 hours, it is termed having *watch and watch*, in distinction from keeping all hands at work during one or more watches. *Anchor watch*, a small watch composed of one or two men appointed to look after the ship while at

anchor or in port. (b) A certain part of the officers and crew of a vessel who together attend to working her for an allotted time. The crew of every vessel while at sea is generally divided into two portions: the *star-board watch*, which in the merchant service is the captain's watch, and is often commanded by the second mate; and the *port-watch*, which in the merchant service is commanded by the chief mate. In the royal navy these watches are commanded by the lieutenants successively.—7. Anything by which the progress of time is perceived and measured; as, (a) a candle marked out into sections, each of which was a certain time in burning.

Fetch me a bowl of wine. Give me a *watch*. *Shak.*

(b) A small time-piece, now universally circular in shape, to be carried in the pocket or about the person. The essential parts of a watch are the dial on which the hours, minutes, and seconds are marked, the hands which move round the dial pointing to these divisions, the train of wheels which carry round the hands, &c., the balance which regulates the motion of the wheels, and the coiled spring (the mainspring), whose elastic force produces the motion of the whole machinery, the movement being inclosed in a protecting case usually of gold or silver.—A *repeating watch* or *repeater* has in addition a small bell, gong, or other sounding object on which the hours, half-hours, quarters, &c., are struck on the compression of a spring. A *chronometer watch* or *pocket chronometer* is one of the finest kinds of watches fitted with a compensation balance and other devices which prevent the variations of temperature from affecting the regular movement of the watch. (See CHRONOMETER.) Watches were invented at Nürnberg about the beginning of the sixteenth century, and for a long time the wearing of a watch was considered in some degree a mark or proof of gentility. Thus Malvolio remarks in anticipation of his great fortune.

I frown the while; and perchance wind up my *watch*, or play with my—some rich jewel. *Shak.*

8. In *pottery*, a trial piece of clay so placed in a kiln that it can be readily withdrawn to enable the workmen to judge by its appearance of the heat of the fire, and the condition of the ware remaining in the saggars.—The *Black Watch*, a name originally given to certain armed companies, whose uniform partly consisted of a dark tartan, and who were employed by government as an organized force about 1730 to watch the turbulent Highlands of Scotland. In 1739 these companies were embodied into a regular regiment, the 43d infantry regiment of the British army, which still retains the historic appellation of the *Black Watch*.—*Watch and ward*, the ancient custom of watching by night and by day in towns and cities. English writers up to the seventeenth century recognize a distinction between *watch* and *ward*, the former being used to signify a watching and guarding by night, and the latter a watching, guarding, and protecting by day. Hence, when the terms were used in combination, especially in the phrase to *keep watch and ward*, they implied a continuous and uninterrupted watching and guarding, constant vigilance and protection by night and by day.

The whole column, which after the junction extends from the sea to the clouds, assumes a magnificent appearance, being of a light colour near its axis, but dark along the sides.

When acted on by the wind the column assumes a position oblique to the horizon, but in calm weather it maintains its vertical position, while at the same time it is carried along the surface of the sea. Sometimes the upper and lower parts move with different velocities, causing the parts to separate from each other, often with a loud report. The whole of the vapour is at length absorbed in the air, or it descends to the sea in a heavy shower of rain. Sudden gusts of wind, from all points of the compass, are very common in the vicinity of water-spouts. What are sometimes called *water-spouts on land* are merely heavy falls of rain of a very local character, and may or may not be accompanied with whirling winds. They occur generally during thunder-storms, and differ only from severe hail-storms in point of temperature.

Sax. weagan*, a wave, a word perhaps allied to the verb to *wag*; Icel. *vagr*, *G. wage*, *D. woe*, a wave; the form of the word in English has been modified by the verb to *weave*, so that *weave* the noun may be regarded as a kind of hybrid word. See **WAVE**, *v. t.*] 1. An undulation, swell, or ridge on the surface of water or other liquid resulting from the oscillatory motion of its component particles, when disturbed from their position of rest by any force; especially, the rolling swell produced on the surface of the sea or other large body of water by the action of the wind; a billow; a surge. When the surface of a liquid is pressed down at any part, the adjoining parts rise, but sink again by the action of gravity; and acquiring a momentum proportionate to the mass and height, descend below the original level, displacing other parts near them, which rise and sink in a similar manner. The result is a reciprocating motion, the particles to which the primitive impulse was communicated being alternately the lowest and the highest, forming the series of ridges and hollows called *waves*. Where the depth of the liquid is invariable over its extent, or sufficient to allow the oscillations to proceed unimpeded, no progressive motion takes place, each ridge or column being kept in its place by the pressure of the adjacent columns. Should, however, free oscillation be prevented, as by the shelving of the shore, the columns in the deep water are not balanced by those in the shallower parts, and they thus acquire a progressive motion towards the latter, or take the form of *breakers*, hence the waves always roll in a direction towards the shore, no matter from what point the wind may blow. When waves are produced by the disturbance of a small quantity of the liquid, as when a pebble is thrown into a pool, they appear to advance from the disturbed point in widening concentric circles, the height of the wave decreasing gradually as it recedes from the centre; but there is no progressive motion of the liquid itself, as is shown by any body floating on its surface. The whole seems to roll onwards, but, in reality, each particle of water only oscillates with a vertical ascent and descent. The height of the wave depends in a great measure on the depth of the water in which it is produced. The waves of the ocean have been known in some instances to have reached a height of 43 feet, measured from the trough to the crest. The horizontal pressure of a strong Atlantic wave, as tested by Stephenson's marine dynamometer, has been recorded as high as 3 tons to the square foot. It is a matter of common observation that a wave of much greater dimension than others occurs at certain intervals, rolling much higher on the shore than those im-

mediately preceding or following it, or breaking with immense force over the decks of vessels on the open sea. This is caused when several coexisting series of waves moving with different velocities meet, and the crests of two or three of them become superimposed upon each other. Several series of waves moving in different directions may also coexist without destroying each other, giving rise to the chopping seas or cross swells so troublesome to mariners. The length of a wave is equal to the space between the most elevated points of two adjoining waves, or between the lowest points of two adjoining hollows. A wave is said to have passed through its length when its elevated part has arrived at the place where the elevated part of the next wave stood before; or, the situation of two contiguous waves being given, when one of these has arrived at the place of the other; and the time which is employed in this transition is called the time of a wave's motion or the time of an undulation. The velocity of a wave is the rate at which the points of greatest elevation or depression seem to change their places.—*Tidal wave*. See **TIDE-WAVE**.—2. In *physics*, a vibration propagated from one set of particles of an elastic medium to the adjoining set, and so on; sometimes, but not always, accompanied with a small permanent displacement of such particles. The theory of the motion of waves is of great importance in physical science; since, not only is it connected with the phenomena of the waves of the ocean ordinarily produced by the wind, the tidal wave, &c., it has also a close relation to the phenomena of undulating musical strings, the undulations in solids, as in earthquake waves, &c., while we know that sounds in air are propagated as waves, and that even light is now generally held to be a form of wave-motion. See **SOUND**, **LIGHT**, **UNDULATORY**.—3. *Water*. [Poetical.]

and employed in the construction of their cells; usually called *Bees'-wax*. Its native colour is yellow, and it has a peculiar smell resembling honey, which is derived from the honey deposited in the cells. When bleached and freed from impurities, wax is white, brittle, and translucent in thin segments; it has neither taste nor smell; it has a specific gravity of from 0.960 to 0.968. It melts at 155° and softens at 86°, becoming so plastic that it may be moulded by the hand into any form. It is a mixture of three substances, called respectively myricin, cerotic acid, and cerolin, in very variable proportions. These substances are themselves composed of carbon, hydrogen, and oxygen. Wax is extensively employed both in its original and bleached state; in the latter state it is used for candles, and in numerous cerates, ointments, and plasters. It is also used in forming figures or images, busts, &c., in the preparation of anatomical models, in the preparation of artificial fruit, flowers, &c. In statuary it is used in making models for the metal cast. — 2. Any substance resembling wax in appearance, consistence, plasticity, or other properties; as, (a) a vegetable product which may be regarded as a concrete fixed oil; the principal varieties being Chinese wax, cow-tree wax, Cuba wax, and Japan wax. It may be obtained from the pollen of many flowers, and it forms a part of the green fecula of many plants, particularly of the cabbage. It appears as a varnish upon the fruit and the upper surface of the leaves of many trees, as in the wax-palm and wax-myrtle. Called also *Vegetable Wax*. (b) A mineral product, one of certain fossil hydrocarbons which occur in small quantities generally in the carboniferous formation; called more fully *Mineral Wax*. The most familiarly known variety is ozocerite (which see). (c) A thick tenacious substance excreted in the ear; ear-wax. (d) A substance found on the hinder legs of bees, derived from the pollen of flowers. This was long supposed to be the substance from which bees elaborated the wax for their cells, but this notion is now found to be erroneous. The pollen collected by bees serves for the nourishment of their larvae. (e) A substance used in sealing letters. See **SEALING-WAX**. (f) A thick resinous substance used by shoemakers for rubbing their thread.

**Wax** (waks), *v. t.* To smear or rub with wax; to apply wax to; to treat with wax; as, to *wax* a thread or a table.

Weavers were supposed to be generally good singers. Their trade, being sedentary, they had an opportunity of practising, and sometimes in parts. Many of the weavers at Queen Elizabeth's time were French Calvinists, who fled from the persecution of the Duke of Alva, and were therefore particularly given to singing psalms. . . . Hence the estimation of Falstaff.

the remarkable structure of their nests, which are woven in a very wonderful manner of various vegetable substances. Some species build their nests separate and singly, and hang them from slender branches of trees and shrubs, but others build in companies, numerous nests suspended from the branches of a tree being under one roof, though each one forms a separate compartment and has a separate entrance. They are natives of the warmer parts of Asia, of Africa, and of Australia, none being found in Europe or America. The *Ploceus ictercephalus*, or yellow-crowned weaver, is a native of South Africa, and constructs an isolated pensile kidney-shaped nest, about 7 inches long by 4 broad, with an opening in the side. Naturalists are not quite agreed

as to whether the nests of the weaver-bird are built in their own peculiar manner as a means of preservation against the rain, or against the attacks of serpents and small quadrupeds, probably the latter.

In all kinds of weaving, whether plain or figured, one system of threads, called the *warp* or *wett*, is made to pass alternately under and over another system of threads called the *weft*, *web*, or *chain*. The essential operations are the successive raising of certain threads of the *warp* and the depression of others so as to form a decussation or *shed* for the passage of the weft yarn, which is then beaten up by means of a *lay* or *batten*. Weaving is performed by the hand in what are called *hand-loom*s, or by steam in what are called *power-loom*s, but the general arrangements for both are to a certain extent the same. A piece of wood or metal, thick at one end and sloping to a thin edge at the other, used in splitting wood, rocks, &c. The wedge is a body contained under two triangular

and three rectangular surfaces, as in the figure, where the triangles ABE, DCF are the ends, the rectangles ADEF, BCEF the sides, and the rectangle ABCD the top. The wedge is one of the mechanical powers, and is used for splitting blocks of timber and stone; for producing great pressure, as in the oil-press; and for raising immense weights, as when a ship is raised by wedges driven under the keel, &c. If the power applied to the top were of the nature of a continued pressure, the wedge might be regarded as a double inclined plane, and the power would be to the resistance to be overcome, as the breadth of the back, DC, to the length of the side, DF, on the supposition that the resistance acts perpendicularly to the side. But since the power is usually that of percussion with a hammer, every stroke of which causes a tremor in the wedge, which throws off for the instant the resistance on its sides, no certain theory can be laid down regarding it. To calculate the power, we require the additional elements of weight of the hammer, momentum of the blow, and the intervals between the blows, and further, the amount of tremor in the wedge and its antagonism to the resistance on the sides. All that is known with certainty respecting the theory of the wedge is that its mechanical power is increased by diminishing the angle of penetration DFC. All cutting and penetrating instruments, as knives, swords, chisels, razors, axes, nails, pins, needles, &c., may be considered as wedges. The angle of the wedge in these cases is more or less acute, according to the purposes to which it is to be applied.—2. A mass of metal, especially if resembling a wedge in form. 'A *wedge* of gold of fifty shekels weight.' *Josh. vii. 21*. 'Wedges of gold, great anchors, heaps of pearls.' *Shak*.—3. Something in the form of a wedge.

See how in warlike muster they appear,

Some of these are constructed on the principle of the lever or steelyard, others on that of a combination of levers, and others on that of the spring-balance. That property of bodies by which they tend toward the centre of the earth; gravity; as, a body has weight or has no appreciable weight.—2. The measure of the force of gravity, as determined for any particular body; the measure of the force by which any body or a given portion of any substance gravitates or is attracted to the earth; in a more popular sense, the amount which anything weighs; the quantity of matter as estimated by the balance or expressed numerically with reference to some standard unit; as, a bar of metal having a weight of 5 lbs.; a load of 3 tons weight. In determining weight in cases where very great precision is desired, due account must be taken of temperature, elevation, and latitude. The apparent weight of any substance is less than its true weight by the weight of as much air as is displaced by it; therefore, as the density of the air is variable—air when warmed expanding very much more than any solid—a piece of metal appears to weigh more in warm than in cold weather. Moreover air becomes more dense by an increase of pressure, consequently when the barometer is high all heavy bodies become apparently lighter; when the barometer is low they become heavier.

They are characterized by having fin-like anterior extremities, the posterior extremities having their place supplied by a large horizontal caudal fin or tail, and the cervical bones so compressed as to leave the animal without any outward appearance of a neck. Their abode is in the sea or the great rivers, and they resemble the fishes so closely in external appearance that not only the vulgar, but even some of the earlier zoologists regarded them as belonging to that class. The whales are usually divided into two families, the *Balaenidae* and the *Physeteridae* or *Catodontidae*. The *Balaenidae*, or whalebone whales, are distinguished by the absence of teeth, by the presence of baleen or whalebone, and by the nostrils being placed on the top of the head. also found in considerable numbers in many other parts of the world. Its length is usually about 60 feet, and its greatest circum-

Greenland Whale (*Balaena mysticetus*).

ference from 30 to 40 feet. The razor-backed whale, or northern porqual, is the *Balaenoptera borealis*. It often measures about 100 feet in length, and from 30 to 35 feet in circumference. (See PORQUAL.) The Physeteridae or Catodontidae are characterized by the fact that the palate is destitute of baleen, and the lower jaw possesses a series of pointed conical teeth. The best known species of this family is the sperm-whale or cachalot (*Physeter* or *Catodon macrocephalus*), which averages from 50 to 70 feet in length. (See CACHALOT, SPERMACEETI, where is cut of spermaceti whale.) Some species of Delphinidae are also known as whales. See BELUGA, CAAING-WHALE. —Very like a whale, a phrase applied to anything very improbable, and implying disbelief in what is stated. It takes its origin from a well-known passage in *Hamlet*, act iii. sc. 2. — *Whale's bone*, an old term for ivory, perhaps from the circumstance that the ivory of Western Europe in the middle ages was the tooth of the walrus, which may have been confounded with the whale.

might have been given to *wheat*. It might have been called eared, nutritious, graceful, waving, the incense of the earth.' (In Sanskrit it was called the incense of the earth, *go-dhama*.) 'But it was simply called the *white*, the white colour of its grain seeming to distinguish it best from those plants with which otherwise it had the greatest similarity. For this is one of the secrets of onomatopoeia—that it should express, not the most important or specific quality, but that which strikes our fancy.' *Max Müller*.]

A plant of the genus *Triticum*, and the seed of the plant, which furnishes a white flour for bread and is by far the most important species of grain cultivated in Europe. It grows readily in almost every climate; but its natural home seems to be a temperate climate, and the soils best adapted for its culture are rich clays and heavy loams. Of cultivated wheats there are many varieties, the differences, however, being mostly due to soil, climate, and mode of cultivation. Three primary varieties may be mentioned:

(a) *T. hybernium* (*muticum*), winter or un-bearded wheat; (b) *T. aestivum* (*arietatum*), summer or bearded wheat; (c) *T. Spelta* (*ad-hærens*), spelt or German wheat, which is of much less value than the others, but grows on poorer soils and more elevated localities.

White wheat and red wheat are names applied according to the colour of the grain, the red sorts being generally harder than the white, but of inferior quality, and the yield is less. Winter wheat is sown in the autumn, with the view of being harvested the following year; summer wheat is sown in the spring of the year in which it is reaped. The best English wheat yields from 75 to 85 per cent of fine flour, the inferior kinds only from 54 to 68 per cent. See TRITICUM.

to fifteen, among the chaffy flowers of the wheat, where they are hatched in about eight or ten days, producing little footless maggots, whose ravages destroy the flowers of the plant, and render it shrivelled and worthless. Wheels, as applied to carriages, usually consist of a nave, into which are inserted spokes or radii, which connect it with the periphery or circular ring. Wheels are most important agents in machinery, being employed in a variety of forms and combinations, for the purpose of transmitting motion, regulating velocity, converting one species of motion into another, reducing friction, and equalizing the effect of forces applied in an intermittent or irregular manner. They receive different names according to their forms and uses; as, *balance-wheel*, *cog-wheel*, *crown-wheel*, *dash-wheel*, *eccentric*, *fly-wheel*, *friction-wheel*, *lantern-wheel*, *paddle-wheel*, *pinion*, *pin-wheel*, *planet-wheel*, *ratchet-wheel*, *scape-wheel*, *spur-wheel*, *tread-wheel*, *turbine*, &c., which are described at more or less length according to their importance under these headings. — 2. (d) An instrument of torture generally used for criminals of the most atrocious class, formerly employed in France and Germany. In some places it consisted of a carriage-wheel on which the criminal was placed with his face upwards, and his legs and arms extended along the spokes. On the wheel being moved round the executioner broke the wretch's limbs by successive blows with a hammer or iron bar, and after a more or less protracted interval put an end to the sufferings of his victim by two or three severe blows, called *coups de grâce* (mercy strokes), on the chest or stomach, or by strangling him. In Germany its use lingered down till the beginning of the present century.

4. † The burthen of a song: a doubtful explanation by Steevens.

You must sing, down a-down, an you call him a-down-a.  
O, how the wheel becomes it. *Shak.*

—*Wheel and axle*, one of the mechanical powers, consisting in its primary form of a cylindrical axle on which a wheel, concentric with the axle, is firmly fastened. By reference to figs. 1, 2, it will be seen that this power resolves itself into a lever of the

first order, in which the weight and power are at the ends, and the fulcrum between them. C is the centre or fulcrum; A C and C B are the semi-diameters of the wheel and the axle; and on the principle of the lever the power is to the weight as A C is to C B. The wheel is grooved and carries a coil of rope; another rope is secured to the axle; and when the power is in motion, every revolution of the wheel raises the weight to a height equal to the circumference of the axle or cylinder. In a great many cases a crank takes the place of the wheel, and the circumference described by the handle is substituted for the circumference of the wheel. The power is increased by enlarging the wheel or lengthening the arm of the crank, or by diminishing the diameter of the cylinder; but there is a limit beyond which the increase cannot be obtained with safety. There is a modification of the wheel and axle, called the *double axis machine* or differential windlass, in which the power can be increased with more safety. This is shown in fig. 3, where

b and c are two cylinders of different diameters, firmly fixed on the axle carrying the crank. A. The rope is coiled round the smaller cylinder, carried through a pulley supporting the weight, and then attached to the large cylinder in a contrary direction. When in motion every turn of the crank lifts the weight to a height equal to half the difference between the circumferences of the two axes; and the power is therefore to the weight as this half difference is to the circumference of the power, or the circle described by the crank A. Hence the power is increased by making the axes more nearly of the same diameter; but there is a limit to this increase, since if b and c come to be of equal thickness, the weight would not rise at all, the rope, in that case, wound upon b being only equal to that unwound from c. (See under DIFFERENTIAL.) The wheel and axle is sometimes called the *perpetual lever*, in consequence of the power being continued by the revolution of the wheel. The common winch, the windlass, the capstan, and the treadmill are so many applications of the wheel and axle. — *Wheels within wheels*, a complication of circumstances, motives, influences, or the like.

It was notorious that after this secretary retired the king's affairs went backwards; *wheels within wheels* took place. *Roger North.*

[In the last extract the interrogative is used indirectly.]—2. A relative pronoun, serving as the neuter of *who*, and having an antecedent of the singular or plural number but of the neuter gender; as, the thing or things *which*; the birds *which* were singing; or the antecedent may be a sentence, word, or notion; as, he is very ignorant, *which* is a great pity. Such usages as the following are now obsolete. 'Our Father *which* art in heaven.' Mat. vi. 9. 'All those friends *which* I thought buried.' *Shak*. 'Had I been there *which* am a silly woman.' *Shak*. Sometimes equivalent to 'a thing or circumstance *which*,' the relative clause preceding that which is referred to.

These birds are commonly called *widow-birds*, but whether this be merely a translation of their Latin generic name *Vidua*, which may have been given from the sombre hue of the plumage, or whether it be a corruption of Whidah, is uncertain.

**Whig** (whig), *n.* [If the historical account below is correct, the origin would seem to be the Sc. word *whig*, to jog along briskly, the connections of this being doubtful.] 1. A designation given to the members of one of the great political parties in Britain. The term is of Scottish origin, and was first used in the reign of Charles II. According to Bishop Burnet it is derived from *whiggam*, a word which was used by the peasants of the south-west of Scotland in driving their horses. He tells us that people from this quarter used often to come to Leith with their horses for corn, and from this peculiar word were called *whiggamores*, contracted to *whigs*. In 1648, after the news of the Duke of Hamilton's defeat, the clergy of the west of Scotland stirred up the people to rise and march to Edinburgh, and they themselves marched at the head of their parishioners. The Marquis of Argyll and his party came and headed them. 'This was called the *whiggamores' inroad*, and ever after that all that opposed the court came, in contempt, to be called *whiggs*. From Scotland the word was brought to England, where it has since continued to be used as the distinguishing appellation of the political party opposed to the *Tories*. It was first assumed as a party name by that body of politicians who were most active in placing William III. on the throne of England. Generally speaking, the principles of the Whigs have been of a popular character, and their measures, when in power, tending to increase the democratic influence in the constitution. The term *Liberals* is now generally applied to the representatives of this party; while the extreme section of the party may be said to have dropped all connection with the Whigs, and have adopted the name of Radicals. See **TORY**.—2. In *American hist.* (a) a friend and supporter of the principles of the revolution; opposed to *Tory* and *Royalist*. —*Whispering gallery or dome*, a gallery or dome in which the sound of words uttered in a low voice or whisper is communicated to a greater distance than under any ordinary circumstances. Thus in an elliptical chamber, if a person standing in one of the foci speak in a whisper he will be heard distinctly by a person standing in the other focus, although the same sound would not be audible at the same distance under any other circumstances or at any other place in the chamber. **Whist** (whist), *n.* A well-known game at cards, said to be so called because the parties playing it have to be *whist* or silent, but this is doubtful. Another name was *whisk*. The game is played with the full pack of fifty-two cards by four persons, two being partners against the other two, each player receiving thirteen cards dealt out one by one in rotation. The last card dealt is turned face up, and is called the trump card; it gives a special power to the suit to which it belongs. The cards rank as follows: ace (highest), king, queen, knave, and the others according to their number of pips. Play is commenced by the person on the left hand of the dealer laying down a card face up on the table, the other players following in succession with cards of the same suit if they have them. When all have played the player who has laid the highest card takes the four cards laid down, which constitute a trick. The winner of the trick then leads, as the first of a new trick, the winner of which becomes the leader, and so on. When a player cannot play a card of the same suit, he may play one of the trump suit, and take the trick, or lay one of a different suit, which gives him no chance of winning the trick. When the hand is played out the score is taken as follows: the partners who conjointly gain the majority of tricks score one point for every trick taken above six. The ace, king, queen, and knave of the trump suit are called honours, and count one each for the side who holds them; if one side hold three honours, they count two by honours, as the opposite side can have but one; if one side hold all the honours, four by honours is counted; should the honours be equally divided neither side counts, the honours being then said to cancel each other. In *long whist*, an obsolescent form of the game, ten of these points made a game. In *short whist*, the game now

Lith. and O. Prus. *kas*, Rus. *koi*, L. *qui*, Gr. *kos*, *pos*, W. *pry*, Gael. and Ir. *co*, Per. *ki*, Skr. *kas*—who. *Whose*, *whom*, are found as relatives about the end of the twelfth century; but *who* not until the fourteenth century, and was not in common use before the sixteenth century.' *Dr. Morris*. In genuine idiomatic Scotch *who* or *wha* (including also the possessive and objective) is still only an interrogative, *that* or *'at* being the relative. Akin are *whene*, *whither*, *which*, &c.] A relative and interrogative pronoun always used substantively (that is, not joined with a noun), and with relation to a person or persons. It remains uninflected for number, but has the form *whom* for the objective and *whose* for the possessive. (*Whose* is also used for the possessive of *which* or *that* used as a rela-

tive.) (a) Used interrogatively *who* = *what* or *which* person or persons?

*Who* hath we? *who* hath sorrow? *who* hath contentions? Prov. xxiii. 29.

*Whom* have I in heaven but thee? Ps. lxxiii. 25. In such a sentence as, I do not know *who* you are, *who* is the indirect or dependent interrogative. (b) Used relatively = *that*.

I sought him *whom* my soul loveth. Cant. iii. 1. Happy the man, and happy he alone, He *who* can call to-day his own. *Dryden*.

(c) Sometimes used elliptically for *he*, *they*, or *those*, *who* or *whom*.

*Who* talks much must talk in vain. Gay. *Whom* the gods love die young. Byron.

—As *who* should say, as one who should say; as if he should say.

He wistly look'd on me As *who* should say 'I would thou wert the man.' *Shak*.

—*Who*, *Which*, *That*. These agree in being relatives, *who* being used for persons, *which* for things, and *that* being used indifferently for either. *Who* and *which* have well-defined different uses: (a) they connect two co-ordinate sentences; as, I met a policeman *who* showed me the way; I studied geometry *which* I found useful. Each of these sentences could be turned into two propositions grammatically, as well as logically, independent: I met a policeman and he showed me the way; I studied geometry and it I found useful. Another use of the same nature is when the second clause is of the kind termed adverbial, where we may still resolve *who* and *which* into a personal or demonstrative pronoun and a conjunction; as, why should we condemn James *who* (for he, seeing that he) is innocent? why should we study phrenology *which* (seeing that it) is profitless? (b) They are often used to introduce subordinate or adjectival clauses, which serve to define or explain a noun regarding which a statement is made in the principal clause; as, I saw the man *who* first taught me to swim; the house *which* he built still stands. Now, in these latter uses, *who* and *which* cannot be turned into *and*, *he*, and *it*. The following sentence, standing alone, is ambiguous: 'I re-read the book *which* gave me much pleasure.' This may mean either that the re-reading gave much pleasure, and in that case the sentence consists of two co-ordinate sentences and belongs to section (a), or it may mean I re-read the book which when formerly read gave me much pleasure. In the latter case the second clause limits or explains the object of the first and belongs to section (b). To remove such ambiguity, and the unpleasant effect arising from the too frequent use of *who* and *which*, it has been proposed by some grammarians (especially Professor Bain) always to employ *that* and not *who* or *which*, when the relative is used to introduce a restrictive or adjectival clause, and instead of saying 'the man *who* hath no music in himself' . . . is fit for treasons, &c., 'they are the books' . . . *which* nourish all the world', to say, as Shakspeare says, 'the man *that* hath, &c.,' 'they are the books' . . . *that* nourish, &c., reserving *who* and *which* for such cases as are noticed under section (a). See also *THAT*.

That faculty or power of the mind by which we determine either to do or not to do something which we conceive to be in our power; the faculty which is exercised in deciding, among two or more objects, which we shall embrace or pursue; the power of producing acts of willing; the power of control which the mind possesses over its own operations.

Appetite is the will's solicitor, and the will is appetite's controller; what we covet according to the one, by the other we often reject. Hooker.

Every man is conscious of a power to determine in things which he conceives to depend upon his determination. To this power we give the name of will. Reid.

2. The act of willing; the act of determining choice or forming a purpose; volition.

It is necessary to form a distinct notion of what is meant by the word 'volition' in order to understand the import of the word 'will,' for this last word expresses the power of mind of which volition is the act. . . . The word 'will,' however, is not always used in this its proper signification, but is frequently substituted for 'volition,' as when I say that my hand moves in obedience to my will. D. Stewart.

Is of the same opinion still. Hudibras.

*Inclination* is another word with which *will* is frequently confounded. Thus, when the apothecary says in *Romeo and Juliet*:

My poverty and not my will consents, &c.

the word *will* is plainly used as synonymous with *inclination*, not in the strict logical sense, as the immediate antecedent of action. It is with the same latitude that the word is used in common conversation, when we speak of doing a thing which duty prescribes, against one's own will; or when we speak of doing a thing willingly or unwillingly.

D. Stewart.

7. In law, the legal declaration of a man's intentions as to what he wills to be performed after his death in relation to his property; a testament. In England no will, whether of real or personal estate, is to be valid unless it be in writing, and signed at the foot or end by the testator, or by some person in his presence, and by his direction. Such signature must be made or acknowledged by the testator in the presence of two or more witnesses present at the same time, and such witnesses must attest and subscribe the will in the presence of the testator. Soldiers on actual service, or mariners at sea, have the power of making *nuncupative wills*. In the United States the law is in substantial agreement with that of England. In Scotland formerly only personal property could be disposed of by will, real property being conveyed by a disposition or deed in which the testator's interest in the subject was reserved, but heritable property can now be so disposed of.—Good will, (a) favour; kindness. (b) Right intention. Phil. i. 15.—Ill will, enmity; unfriendliness. It expresses less than malice. See GOOD-WILL and ILL-WILL.—To have one's will, to obtain what is desired.—To work one's will, to act absolutely according to one's own will, wish, pleasure, or fancy; to do entirely what one pleases with something.

For though the Great Ages leave the hill

And break the shore, and evermore

He threw himself into the business with a will. Dickens.

**Will** (wil), *v. aux.*, pres. I *will*, thou *wilt*, he *will*; past *would*; no past participle. [A. Sax. *willan*, pres. sing. 1 and 3 *wile*, 2 *wilt*, pl. *willath* (1, 2, and 3); pret. *wolde*, *woldet*; pl. *woldon* or *woldan*; D. *willen*, Icel. *vîlja*, Dan. *villie*, to will; G. *will*, I will, he will, infin. *wollen*; Goth. *vîljan*; cog. L. *volô*, I will, *vellô*, to will; Gr. *boulomai*, I will. Aktn *will*, *weal*, *wild*.] A word denoting either simple futurity or futurity combined with volition according to the subject of the verb. Thus, in the first person, I (we) *will*, the word denotes willingness, consent, intention, or promise; and when emphasized it indicates determination or fixed purpose; as, I *will* go, if you please; I *will* go at all hazards; I *will* have it in spite of him. In the second and third persons *will* expresses only a simple future or certainty, the idea of volition, purpose, or wish being lost; thus, 'you *will* go,' or 'he *will* go,' indicates a future event only. The second person may also be used as a polite command; as, you *will* be sure to do as I have told you.—As regards *will* in questions Mr. R. Grant White lays down the following rules: 'Will is never to be used as a question with the first person; as, *will* I go? A man cannot ask if he *will* to do anything that he must know and only he knows. . . . As a question, *will* in the second person asks the intention of the person addressed; as, *will* you go to-morrow? That is, Do you mean to go to-morrow? . . . As a question, *will* in the third person asks what is to be the future action of the person spoken of, with a necessary reference to intention; as, *will* he go? that is, Is he going? Does he mean to go and is he going sure?' Simple futurity with the first person is appropriately expressed by *shall*. (See SHALL.) Among inaccurate speakers and writers, especially in Scotland, Ireland,

and in some parts of the United States, there is some confusion in the use of *shall* and *will*; thus *will* improperly takes the place of *shall* in such frequently used phrases as, 'I *will* be obliged to you,' 'we *will* be at a loss,' 'I *will* be much gratified,' and so on. — *Would* stands in the same relation to *will* that *should* does to *shall*. Thus *would* is seldom or never a preterite indicative pure and simple, being mainly employed in subjunctive, conditional, or optative senses, in the latter case having often the functions and force of an independent verb; as, (a) conditional or subjunctive, 'he *would* do it if he could,' 'he could do it if he *would*,' 'they *would* have gone had they been permitted,' Here it will be seen *would* refers to the present only, the past being expressed by *would have*. In such sentences as 'He was mistaken it *would* seem,' or 'it *would* appear' — in which *should* is sometimes used — *would* retains almost nothing of conditionality, having merely the effect of softening a direct statement. (Mr. R. Grant White regards 'it *should* seem' as the normal expression, though he quotes 'it *would* appear' from good English writers. He himself writes, 'It *would* seem that a man of Mr. Lowe's general intelligence should know,' &c. *Everyday English*, chap. xiii.) (b) Optative: 'I *would* that I were young again.' In this use the personal pronoun is often omitted. 'Would to God we had died in Egypt.' Ex. xvi. 3. 'Would God I had died for thee, O Absalom.' 2 Sam. xviii. 3. 'Would thou wert as I am.' *Shak.* — *Would* most nearly has the force of a simple past indicative in such sentences as, 'he *would* go and you see what has happened,' but this implies farther that he did actually go or at least set out, and the *would* is here emphatic. — *Would* is also used to express a habit or custom, as if it implied a habitual exercise of will; as, she *would* weep all day; every other day he *would* fly into a passion. — *Will* and *would* were formerly often used with adverbs and prepositional phrases to express motion or change of place, where modern usage would require *will go*, *would go*, or the like. 'Now I *will* away,' 'I'll to the ale-house,' 'I *will* about it,' 'I'll to my books,' 'he is very sick and *would* to bed,' 'there were wit in this head, an' *would* out.' *Shak.* — What may be called a similar elliptical usage occurs in such phrases as 'what *would* you?' where present usage *would* supply *have* or *do*.

**Willow** (wil'lo), *n.* [A. Sax. *welig*, *wilig*, D. *wilg*, L. G. *wilge*, a willow; probably from root of *wallow*, L. *volvo*, to roll, from the flexibility of its twigs.] 1. The common name of different species of plants belonging to the genus *Salix*, the type of the natural order Salicaceae. The species of willows are numerous, about 160 having been described, many of which are British. They are all either trees or bushes, occurring abundantly in all the cooler parts of the northern hemisphere. They grow naturally in a moist soil, and wherever planted they should be within the reach of water. On account of the flexible nature of their shoots, and the toughness of their woody fibre, willows have always been used as materials for baskets, hoops, crates, &c. The wood is soft, and is used for wooden shoes, pegs, and the like; it is also much employed in the manufacture of charcoal, and the bark of them all contains the tanning principle. The Huntingdon or white willow (*Salix alba*) and the Bedford willow (*S. Russelliana*) are large trees, yielding a light soft timber, valuable for resisting the influence of moisture or damp. The weeping willow (*S. babylonica*) is a native of China, and is a fine ornamental tree. The willow has for long been considered as symbolical of mourn-

ing, grief, bereavement, forsakenness, or the like.

**Wind** (wɪnd, in poetry often *wind*), n. [A. Sax. D. and G. *wind*, Dan. and Sw. *vind*, Icel. *vindr*, Goth. *vinds*; cog. L. *ventus*, W. *gwynt*, wind. The root is in Goth. *wasan*, Skr. *vā*, to blow. *Weather* is from same root.] 1. Air naturally in motion with any degree of velocity; a current of air; a current in the atmosphere, as coming from a particular point. When the air moves moderately, it is called a light wind or a breeze; when with more velocity, a fresh breeze; and when with violence, a gale, storm, tempest, or hurricane. The principal cause of those currents of air is the disturbance of the equilibrium of the atmosphere by the unequal distribution of heat. When one part of the earth's surface is more heated than another, the heat is communicated to the air above that part, in consequence of which the air expands, becomes lighter, and rises up, while colder air rushes in to supply its place, and thus produces wind. As

oil, pound; u, Sc. abune; y, Sc. fey.

Fâte, far, fat, fâll; mé, met, hér; pine, pin; nôte, not, môve; tûbe, tub, bull;

the heat of the sun is greatest in the equatorial regions, the general tendency there is for the heavier columns of air to displace the lighter, and for the air at the earth's surface to move from the poles toward the equator. The only supply for the air thus constantly abstracted from the higher latitudes must be produced by a counter-current in the upper regions of the atmosphere, carrying back the air from the equator towards the poles. The quantity of air thus transported by these opposite currents is so nearly equal, that the average weight of the air, as indicated by the barometer, is the same in all places of the earth. Besides the unequal distribution of heat already mentioned, there are various other causes which give rise to currents of air in the atmosphere, such as the condensation of the aqueous vapours which are constantly rising from the surfaces of rivers and seas, and the agency of electricity. Winds have been divided into *fixed* or *constant*, as the trade-winds; *periodical*, as the monsoons; and *variable winds*, or such as blow at one time from one point, at another from another point, and at another time cease altogether. (See TRADE-WIND, MONSOON.) There are also various local winds, which receive particular names; as, the *Etesian wind*, the *Sirocco*, the *Sinoom*, the *Harmattan*, the *Mistral*, *Typhoon*, &c. (See these terms.) The velocity and force of the wind vary considerably, as shown by the anemometer. Thus a light wind travelling at the rate of 5 miles an hour exercises a pressure of 2 oz. on the square foot; a light breeze of 10 miles an hour has a pressure of 8 oz.; a good steady breeze of 20 miles, 2 lbs.; a storm of 60 miles, 18 lbs.; a violent hurricane of 100 miles, 50 lbs., a pressure which sweeps everything before it. Winds are denominated from the point of compass from which they blow; as, a *north wind*, an *east wind*, a *south wind*, a *west wind*, a *south-west wind*, &c.

Except *wind* stands as it has never stood,  
It is an ill *wind* that turns none to good. *Tusser*.

The name is, however, generally restricted to the orchestral instruments of the second class, consisting of a tube (straight, bent, or curved), producing a fundamental tone with its harmonics or overtones when the vibrating column extends the whole length of the tube. This column may, however, be shortened by having holes of certain sizes and at certain distances along the tube, which are opened or stopped by the fingers or valves, the instrument being thus adapted to produce in its simpler forms the tones of the diatonic scale, and in its more complex forms the tones of the chromatic scale. The wind-instruments of an ordinary orchestra are divided into two classes: wood instruments, as the flute, oboe, clarinet, and bassoon; and brass instruments, as the horn, cornet-a-pistons, trombone, euphonium, bombardon, and ophicleide. The quality of tone of the woods is soft, smooth, light, and almost vocal; that of the brasses is somewhat harder, more powerful and majestic. Being all fixed toned they cannot, of course, play in perfect tune like

stringed instruments, and they can only produce one sound at a time.

**Windmill** (wind'mil), *n.* 1. A mill which receives its motion from the impulse of the wind, and which is used for grinding corn, pumping water, &c. The structure of a

windmill is a conical or pyramidal tower of considerable height, with a conical or hemispherical dome. There are two kinds of windmills, the vertical and horizontal. In the former, a section of which is here given,

Section of upper part of Windmill.

the wind is made to act upon sails or vanes, *AA* (generally four in number), attached by means of rectangular frames to the extremities of the principal axis or *wind-shaft* of the mill, which is placed nearly horizontal, so that the sails, by the action of the wind, revolve in a plane nearly vertical, giving a rotary motion to the driving-wheel *E* fixed to the wind-shaft, and thus conveying motion to the vertical shaft *F* and the machinery connected with it. The extremity of the wind-shaft must always be placed so as to point to the quarter from which the wind blows. To effect this some mills have a self-adjusting cap *B*, which is turned round by the force of the wind acting upon the fan or flyer *C*, attached to the projecting framework at the back of the cap. By means of a pinion on its axis, motion is given to the inclined shaft and to the wheel *D* on the vertical spindle of the pinion *A*, this latter pinion engages the cogs on the outside of the fixed rim of the cap; by these means the sails are kept constantly turned to the wind, the head of the mill moving slowly round the moment any change in the direction of the wind causes the fan *C* to revolve. In the horizontal windmill the wind-shaft is vertical, so that the sails revolve in a horizontal plane. The effect of horizontal windmills, however, is considered to be far inferior to that of the vertical kind. The effect of windmills depends greatly upon the form and position of the sails. See also *POST-MILL*.—2. A visionary scheme; a vain project; a fancy; a chimæra.

1. The fermented juice of the grape or fruit of the vine (*Vitis vinifera*). See *VITIS*. Wines are distinguished practically by their colour, hardness or softness on the palate, their flavour, and their being still or effervescing. The differences in the quality of wines depend partly upon differences in the vines, but more on the differences of the soils in which they are planted, in the exposure of the vineyards, in the treatment of the grapes, and the mode of manufacturing the wines. When the grapes are fully ripe, they generally yield the most perfect wine as to strength and flavour. The leading character of wine, however, must be referred to the alcohol which it contains, and upon which its intoxicating powers principally depend. The amount of alcohol in the stronger ports and sherries is from 16 to 25 per cent; in hock, claret, and other light wines from 7 per cent. Wine containing more than 13 per cent of alcohol may be assumed to be fortified with brandy or other spirit. The most celebrated ancient wines were those of Lesbos and Chios among the Greeks, and the Falernian and Cecuban among the Romans. The principal modern wines are Port, Sherry, Claret, Champagne, Madeira, Hock, Marsala, &c. &c. The varieties of wine produced are almost endless, and differ in every constituent according to the locality, season, and age; but generally the produce of each vineyard retains its own leading characteristics. The principal wine-producing countries are France, Germany, Spain, Portugal, Sicily, Greece, Cape Colony, Australia, and America. — 2. 1. One of the anterior limbs in birds, corresponding to the arms in man, and in most cases serving as organs by which flight is effected, though in some birds they merely aid in running or swimming. Normally the wings consist of the bones of the fore-limbs, specially modified and provided with feathers. To that part of the limb analogous to the hand are attached the primaries or greater quill-feathers, the secondaries are affixed to the forearm, and the arm supports the tertiaries and scapulars. The bone which represents the thumb gives rise to the bastard quills, and along the base of the quills are ranged the wing-coverts. Wings are attributes of some of the gods of antiquity, of demons, and of many imaginary beings. In Christian art the use of wings is limited to angels and devils. — 2. An organ used for flying by some other animals. In insects, the wing is formed of two delicate skin layers, supported on hollow tubes or nervures placed in communication with the respiratory system. The forms of insect wings are very various; some of the more important diversities being characteristic of different orders. The wings of *bats* consist of a fold of skin which commences at the neck and extends on each side between the fore-legs or arms and the posterior limbs. In the flying-phalangers, flying-squirrels, &c., the expansion of skin extending along the sides of the body serves as a mere parachute, and is no organ of true flight. — 3. Used emblematically, (a) of swiftness, or of anything that carries the mind upwards or along; means of flight or of rapid motion; as, fear adds *wings* to flight. 'Fiery expedition be my *wing*.' Shak. 'Borne by the trustless *wings* of false desire.' Shak. (b) Of care or protection; often in the plural. In the shadow of thy *wings* will I rejoice. Ps. lxxiii. 7. They are said to live for years in the larva state, during all which time they are very destructive to cornfields and also to vegetables by attacking the roots. **Wis** (wis), *v.* Erroneously given in many dictionaries as a verb, with the pret. *wist*, and defined, to know, to be aware, to think, &c. But *wist* belongs to *wit*, to know (see **WIT**), and there never was a real verb *wis*, to know. The error seems to have arisen from the adverb *Y-wis*, *i-wis* (certainly), being frequently written with the prefix apart from the rest of the word, and often with a capital letter so as to appear as *Y-wis*, or *I-wis*; hence the *I* was mistaken for the first personal pronoun, and the verb *wis* created. No doubt writers themselves (in later times at least) have often thought when they wrote 'I wis' they were using a verb, and have regarded it as equivalent to *I know*, *ween*, or *I imagine*.

It is often nearly synonymous with *discretion*, or with *prudence*, but both of these are strictly only particular phases of wisdom. Frequently we find it implying little more than sound common sense, perfect soundness of mind or intellect; hence it is often opposed to *folly*.

2. A faculty or power of the mind or intellect; generally used in the plural; as, he has all his *wits* about him.

5. The power of original combination under the influence of the imagination; the imaginative faculty.

Wit in poetry . . . is no other than the faculty of imagination in the writer, which . . . searches over all the memory for the species or ideas of those things which it designs to represent.

6. The faculty of associating ideas in a new and ingenious, and at the same time natural and pleasing way exhibited in apt language; the felicitous combination of words and thoughts by which unexpected resemblances between things apparently unlike are vividly set before the mind so as to produce a shock of pleasant surprise; facetiousness.

Wit lies most in the assemblage of ideas, and putting those together with quickness and variety, wherein can be found any resemblance or congruity, thereby to make up pleasant pictures and agreeable visions to the fancy.

True wit consists in the resemblance of ideas. . . . But every resemblance of ideas is not what we call wit, and it must be such an one that gives delight and surprise to the reader. Where the likeness is obvious, it creates no surprise, and is not wit. Thus, when a poet tells us that the bosom of his mistress is as white as snow, there is no wit in the comparison; but when he adds, with a sigh, it is as cold too, it then grows into wit.

True wit is nature to advantage dress, What oft was thought, but ne'er so well express.

[The two extracts following bear on the distinction between wit and humour.]

Dr. Trusler says that wit relates to the matter, humour to the manner; that our old comedies abounded with wit, and our old actors with humour; that humour always excites laughter but wit does not; that a fellow of humour will set a whole company in a roar, but that there is a smartness in wit, which cuts while it pleases. Wit, he adds, always implies sense and abilities, while humour does not; humour is chiefly relished by the vulgar, but education is requisite to comprehend wit.

It is no uncommon thing to hear 'He has humour rather than wit.' Here the expression commonly means pleasantness: for whoever has humour has wit, although it does not follow that whoever has wit has humour. Humour is wit appertaining to character, and indulges in breadth of drollery rather than in play and brilliancy of point. Wit vibrates and spirits; humour springs up exuberantly as from a fountain and runs on. In Congreve you wonder what he will say next; in Addison you repose on what is said, listening with assured expectation of something congenial and pertinent. The French have little humour, because they have little character; they excel all nations in wit because of their levity and sharpness.

7. One having genius, fancy, or humour: in modern usage, one who excels in the faculty defined in last definition; one distinguished for bright or amusing sayings; a humorist.

Sax. *witga*, a common abbreviated form of *witiga* or *witiga*, a prophet, soothsayer, wizard. . . . from *witan*, to see, allied to *witan*, to know.' See WIT, also WISEACRE.] 1. Indeed it was fully believed that they gave themselves up to him, body and soul, while he engaged that they should want for nothing, and be able to assume whatever shape they pleased, to visit and torment their enemies, and accomplish their infernal purposes. As soon as the bargain was concluded, the devil was said to deliver to the witch an imp or familiar spirit, to be ready at call, and to do whatever it was directed. By the aid of this imp and the devil together, the witch, who was almost always an old woman, was enabled to transport herself through the air on a broomstick, and to transform herself into various shapes, particularly those of cats and hares; to inflict diseases on whomsoever she pleased, and to punish her enemies in a variety of ways. The belief in witchcraft is very ancient. It was a common belief in Europe till the sixteenth century, and maintained its ground with tolerable firmness till the middle of the seventeenth century; indeed it is not altogether extinct even at the present day. Numbers of reputed witches were condemned to be burned, so that in England alone it is computed that no fewer than 30,000 of them suffered at the stake. —2. The A. Sax. *with*, opposite, contrary to, against (seen in *withers*), is a comparative from this; like Icel. *viðr*, D. *weeder*, G. *wieder*. In general *with* now implies association, but this was not the notion originally connected with it; its modern meaning indeed has been to some extent borrowed from O.E. and A. Sax. *mid*, *with*, which long ago fell into disuse. The height at

the shoulder is from 27 to 29 inches. The wolf is swift of foot, crafty, and rapacious; a destructive enemy to the sheep-cote and farm-yard; it associates in packs to hunt the larger quadrupeds, such as the deer, the elk, &c. When hard pressed with hunger these packs have been known to attack isolated travellers, and even to enter villages and carry off children. In general, however, wolves are cowardly and stealthy, approaching the sheepfolds and farmsteadings only at dead of night, making a rapid retreat if in the least scared by a dog or a man, and exhibiting great cunning in the avoidance of traps. Wolves are still plentiful in some parts of Europe, as France, Spain, Italy, Germany, Turkey, and Russia; they probably ceased to exist in England about the end of the fifteenth century; the last of their race in Scotland is said to have been killed by Cameron of Lochiel in 1680, while in Ireland they are known to have existed until at least the beginning of the eighteenth century. The black wolf (*C. occidentalis*) of America is a larger and finer animal than his European congener. The little prairie-wolf or coyote (*C. ochropus*), abounding on the vast plains of Missouri and Mexico, is a burrowing animal, and resembles in many respects the jackal. The

Wolf, the great German philologist.—*Wolfian theory*, a theory put out by Wolf in 1795 to the effect that the Iliad and Odyssey cannot be the works of one man, Homer, because writing was unknown at the time that these poems are said to have been composed. He supposes, therefore, that the Iliad and Odyssey consist of ballads or episodes, the work of different men, collected and arranged in a more or less consistent and homogeneous whole in the sixth century B.C. These ballads were preserved by the recitation of strolling minstrels.

It is a native of alpine pastures in Switzerland and other mountainous parts of Europe. It is a common plant in flower borders, and is found in a wild state in one or two parts of England. All the parts of the plant, espe-

cially the roots, are very poisonous, containing a narcotic alkaloid called *aconitin* or *aconitine*, one of the most virulent of all known poisons. Lith. and Lett. *wilna*, Rus. *volna*, Skr. *ûrñd*, wool. Allied to L. *villus*, shaggy hair, *vellus*, a fleece, Gr. *eyerion*, wool; traced to a root signifying to cover, to protect, and supposed to be seen also in L. *vallis*, a valley, and in *valeo*, to be strong. See *VALID*.] 1. That soft species of hair which grows on sheep and some other animals, as the alpaca, some species of goats, &c., which in fineness sometimes approaches to fur. The word generally signifies the fleecy coat of the sheep, which constitutes a most essential material of clothing in all cold and temperate climates. Wool is divided into two classes—*short* or *carding wool*, seldom reaching over a length of 3 or 4 inches, and *long* or *combing wool*, varying in length from 4 to 8 inches, each class being subdivided into a variety of sorts, according to their fineness and soundness of the staple. The finest wools are of short staple, and the coarser wools usually of long staple. Wools which unite a high degree of fineness and softness, with considerable length of staple, bear a high price. English-bred sheep produce a good, strong, combing wool, that of the Scotch breeds being somewhat harsher and coarser. The finest carding wools were formerly exclusively obtained from Spain, the native country of the merino sheep, and at a later period extensively from Germany, where that breed had been successfully introduced and cultivated. Immense flocks of merinos are now reared in Australia, South America, and South Africa, and from these quarters Britain now obtains her chief supply.—2. Less strictly applied to some other kinds of hair; especially to short, thick hair, crisp and curled, like that of a negro.

A phrase in one of our occasional Services has sometimes offended those who are unacquainted with the early uses of English words. . . . I refer to the words in our Marriage Service 'with my body I thee worship.' But 'worship' or 'worshipship' meant 'honour' in our early English, and 'to worship' to honour, this meaning of 'worship' still very harmoniously surviving in the title of 'your worship,' addressed to the magistrate on the bench. So little was it restricted of old to the honour which man is bound to pay to God, that it was employed by Wiclif to express the honour which God will render to his faithful servants and friends. Thus, our Lord's declaration, 'If any man serve me, him will my Father honour,' in Wiclif's translation reads thus, 'If any man serve me, my Father shall worship him.'

The American house-wren (*T. domesticus*) is also a very familiar bird, and a general favourite in America. The name wren has also been given to certain dentirostral birds of the warbler family, such as the golden-crested wren (*Regulus cristatus*), so called from its orange crown or crest. This bird has its haunt in tall trees, suspending its neat and elegant nest, in which it lays nine or ten eggs, from a branch, being the only example of a nest thus supported in Britain. ## Y.

**Y**, the twenty-fifth letter of the English alphabet, was taken from the Latin, the Latin having borrowed it from the Greek *Υ* or *upsilon*. In the Anglo-Saxon alphabet it was always a vowel, and is believed to have had a sound resembling that of French *u* or German *ü*, this being also the sound which the Greek *Υ* is believed to have had. In modern English it is both a consonant and a vowel, and seldom or never is the historical representative of A. Sax. *y*, this being usually represented by *i*. At the beginning of syllables and followed by a vowel it is a consonant of the palatal class, being formed by bringing the middle of the tongue in contact with the palate, and nearly in the position to which the *g* hard brings it. Hence it has happened that in a great number of words *g* has been softened into *y*, as A. Sax. *geār* into *year*, *geornian* into *yearn*, *dæg* into *day*. As an adjective termination it commonly represents A. Sax. *-ig*, as in *stony* = A. Sax. *stīnig*, *greedy* = A. Sax. *grædig*, *hungry* = A. Sax. *hungrig*, *many* = A. Sax. *mænig*. In some nouns it also represents the term *-ig*, as in *honey* = A. Sax. *hūnig*, *withy* = A. Sax. *withig*. In the term *-ly* it stands for *ic* or *ice*, as in *godly* = A. Sax. *godlic*, *friendly* = A. Sax. *frendlic*, *fully* = A. Sax. *fullice*, *hardly* = A. Sax. *heardlice*, &c. In words of Romance origin the term *-y* often represents Fr. *-ie*, *-ia*, as in *history*, *modesty*, *memory*, *victory*; it also represents

L. *-ium*, the noun termination, as in *study*, *remedy*, *subsidy*, &c., or the adjective term. *-ius*, as in *notary*, *contrary*, *secondary*, &c. In nouns ending in *-ty* the *-ty* represents Fr. *-té*, L. *-tas*, *-tatis*, as in *vanity*, *calamity*, &c. In the middle and at the end of words *y* is a vowel, and is precisely the same as *i*. It is sounded as *i* long, when accented, as in *defy*, *rely*, *dying*; and as *i* short when unaccented, as in *vanity*, *glory*, *synonymous*. As a consonant this letter bears much the same relation to *i* (short) as *u* does to *e*; thus *i* short has in certain positions—as in the *ia* of *Christian*—a tendency to pass into *y*. *Y* is sometimes called the Pythagorean letter, from its Greek original representing, by means of its three limbs, the sacred triad, formed by the dual proceeding from the monad.—In *chem.* *Y* is the symbol of yttrium.—*Y*, as a numeral, stands for 150, and with a dash over it, *Y*, for 150,000.

**Y-**. A common prefix in Old English words, as in *y-clept*, *y-clad*, &c., representing A. Sax. *ge-*, which assumed this form by the common weakening of *g* to *y*. The meaning of words with this prefix is usually the same as if it were absent. See *GE*.

There are two distinct species of yacht: the mere racer with enormous spars and sails and deeply-ballasted hull, with fine lines, but sacrificing everything to speed; and the elegant, commodious, well-proportioned travelling yacht, often with steam-propelling machinery, fit for a voyage round the world. The yacht navy of Britain comprehends vessels from 3 to about 600 tons.

There are several varieties of the yak due to climatic influences, character of habitat, food, and, in the case of domesticated animals, to the kind of work to which they are put, as the noble yak, the *ghain-orik*, the plough-yak. The last is a plebeian-looking animal, and wants the magnificent side tufts of hair characteristic of its free brethren. It is employed in agriculture. The yak is often crossed with other domestic cattle, and a mixed breed obtained. The tail of the yak is in great request for various ornamental purposes, and forms quite an important article of commerce. Dyed red it decorates the caps of the Chinese, and when properly mounted it is used as a fly-flapper in India under the name of a chowry.

**Yank** (yangk), *n.* [Contr. of *Yankee*.] A Yankee. [Vulgar.]

**Yankee** (yang'kè), *n.* [A word of uncertain origin. The most common explanation seems also the most plausible, namely, that it is a corrupt pronunciation of *English* or of Fr. *Anglais* formerly current among the American Indians. In Bartlett's *Dictionary of Americanisms* a statement is quoted to the effect that *Yengees* or *Yenkees* was a name originally given by the Massachusetts Indians to the English colonists, and that it was afterwards adopted by the Dutch on the Hudson, who applied the term in contempt to all the people of New England. Bartlett also quotes a statement of Heckwelder (an authority on Indian matters), who affirmed that the Indians applied the term *Yengees* specially to the New Englanders as contradistinguished from the Virginians or Long Knives, and the English proper or Saggenash. As early as 1713 it is said to have been a common cant word at Cambridge, Mass., in the sense of good or excellent, being probably borrowed by the students from the Indians, to whom a 'Yankee' article would be synonymous with an excellent one, from the superiority of the white man in mechanical arts.] A cant name for a citizen of New England. During the American Revolution the name was applied to all the insurgents; and during the civil war it was the common designation of the Federal soldiers by the Confederates. In Britain the term is sometimes applied generally to all natives of the United States.

**Yankee-Doodle** (yang'kè-dò'dl), *n.* 1. A famous air, now regarded as American and national. It is said that the brigade under Lord Percy, after the battle of Lexington, marched out of Boston playing this tune in derisive and punning allusion to the name Yankee, and the New Englanders adopted the air in consideration of the fact that they had made the British dance to it. ## Z.

**Z**, the last letter of the English alphabet, is a sibilant consonant, and is merely a vocal or sonant *S*, having precisely the same sound that *s* has in *wise*, *ease*, *please*, &c. (See *S*.) It did not have a place in the Anglo-Saxon alphabet, though no doubt *s* had sometimes this sound. In old English of the fourteenth century it was common, and in some writings was often used where we now have *s*. The words in modern English which begin with *z* are all derived from other languages, mostly from the Greek. The case was the same in Latin, in which this letter was never really naturalized. When not initial, however, the case is different, and we often find it representing an older *s* in genuine English words, as in *blaze*, *freeze*, *gaze*, *graze*, *guzzle*, *hazard*, *size*, &c. As a final it occurs in some onomatopoeic words, as in *buzz*, *whizz*. In German *z* is very common, being

a double consonant, with the sound *ts*. In Greek it was also a double consonant—*ds* or *sd*. In Britain its name is *zed*, in America *zed* and *zee*.

The stems of all the *zamia*s abound in a mucilaginous juice, which has a nauseous odour and an unpleasant taste, arising from the existence in it of a peculiar proximate principle. This may be removed by boiling, roasting, &c., when some of them form a nutritious article of food. *Caffer-bread* is a common name for the genus in South Africa, where the central part of the stem pith of *Z. cycadis*, after being prepared in a particular way, is formed into cakes, baked, and eaten by the natives. Zebra (*Equus zebra*).

The zebras graze in herds on the steep hillside, and seek the wildest and most sequestered spots, so that they are extremely difficult of approach, not only from their watchful habits and great swiftness of foot, but also from the inaccessible nature of their abodes. The zebra is one of the handsomest, and also one of the wildest and least tractable of animals. Only in a few instances has it been domesticated, for it always retains its vicious, obstinate, and fickle nature. The name zebra is sometimes applied to the quagga and the dauw or Burchell's zebra; but they differ from the zebra in having no stripes on the lower limbs, while those on the body are not so black as the true zebra. **Zinc** (zingk), *n.* [Fr. *zinc*, G. *Sw.* and *Dan.* *zink*; allied to G. *zinn*, tin.] Sym. Zn. At. wt. 65. A metal frequently called *spelter* in commerce. It has a strong metallic lustre and a bluish-white colour. Its texture is lamellated and crystalline, and its specific gravity about 7. It is a hard metal, being acted on by the file with difficulty, and its toughness is such as to require considerable force to break it when the mass is large. At low or high degrees of heat it is brittle, but between 250° and 300° F. it is both malleable and ductile, and may be rolled or hammered into sheets of considerable thinness and drawn into wire. Its malleability is considerably diminished by the impurities which the zinc of commerce contains. It fuses at 773° F., and when slowly cooled crystallizes in four- or six-sided prisms. Zinc undergoes little change by the action of air and moisture. When fused in open vessels it absorbs oxygen and forms the

white oxide called *flowers of zinc*. Heated strongly in air it takes fire and burns with a beautiful white light, forming oxide of zinc. Zinc is found in considerable abundance. It does not occur in the native state, but is obtained from its ores, which are chiefly the sulphide, or *zinc-blende*, and the carbonate or *calamine*. The oxide of zinc (ZnO) is a fine white powder insoluble in water, but very soluble in acids, which it neutralizes, being a very powerful base, of the same class as magnesia. It combines also with some of the alkalies. Zinc forms a series of compounds with organic radicles, such as zinc methyl, Zn(CH<sub>3</sub>)<sub>2</sub>, and zinc ethyl, Zn(C<sub>2</sub>H<sub>5</sub>)<sub>2</sub>. Several of the salts of zinc are employed in medicine, as the sulphate or *white vitriol* (ZnSO<sub>4</sub>), the chloride or *butter of zinc* (ZnCl<sub>2</sub>), the acetate and the cyanide. Sheet-zinc is largely employed for lining water cisterns, baths, &c., for making spouts, pipes, for covering roofs, and several other architectural purposes. Plates of this metal are used as generators of electricity in voltaic batteries, &c.; they are also employed in the production of pictures, &c., in the style of woodcuts. (See ZINCOGRAPHY.) Zinc is much employed in the manufacture of brass and other alloys, and in preparing galvanized iron. See GALVANIZED.

**Zinc** (zingk), *v. t.* To coat or cover with zinc. See GALVANIZED.

Five of the strings are stretched over a fretted keyboard, and are

used for playing the melody, the fingers of the left hand stopping the strings on the frets, the right-hand thumb armed with a metal ring, striking the strings. These strings, which are tuned in fifths, have a chromatic range from C in the second space of the bass staff to D on the sixth ledger-line above the treble. All the remaining strings, called the accompanying strings, are struck by the first three fingers of the right hand, and being untopped produce only the single tone to which they are tuned. The instrument while being played rests on a table with the keyboard side nearest the performer. Tyrol seems to be the native country of this instrument.

They have their name

from their resemblance to flowers, are more or less elongated, and very contractile. They are divided into three sub-orders—*Zoantharia Malacodermata*, in which the corallum is absent or very rudimentary, *Z. Sclerobasica*, in which it is sclerobasic, and *Z. An imaginary belt or zone in the heavens, extending about 8° on each side of the ecliptic. It is divided into twelve equal parts called signs. (See SIGN.) It was marked out by the ancients as distinct from the rest of the heavens because the apparent places of the sun, moon, and the planets known to them were always within it. This, however, is not true of all the newly discovered planets.—2. A girdle; a belt; a zone. [Rare and poetical.]

A series of pictures representing the different attitudes successively assumed by an object in performing any act from its beginning to its close, as by a horseman in leaping a gate, an acrobat performing a somersault, and the like, is arranged along the interior circumference. The instrument is then set in rapid motion, and the person looking through sees the horseman, &c., as if endowed with life and activity, performing the act proper to his character.

They were called respectively *littoral*, *circumlittoral*, *median*, *inframedian*, and *abyssal*. Subsequent researches, notably those of the  *Challenger*, have demonstrated that the assumed facts were to a great extent erroneous, organisms supposed to be confined to the littoral zone having been found at the greatest

**Zoology** (zō-o-lō-jī), *n.* [From Gr. *zōon*, an animal, and *logos*, discourse.] That science which treats of the natural history of animals, or their structure, physiology, classification, habits, and distribution. The term 'natural history' has been frequently used as synonymous with zoology, but such a term is obviously of wider significance, and should be used to indicate the whole group of the natural sciences. Zoology is a branch of biological science, constituting, in fact, with its neighbour branch botany, the science of biology. Its study comprehends such branches as the morphology of ani-

mals, or the science of form or structure, which again includes comparative anatomy, by which we investigate external and internal appearances, the positions and relations of organs and parts; the development of animals, which treats of the various stages leading from the embryonic to the mature state; the physiology of animals, which includes the study of the functions of nutrition, reproduction, and of the nervous system; classification or taxonomy, which assigns to the various individuals their proper place in the scale of life. A new department has been added in recent times, sometimes called *etiology*, which investigates the origin and descent of animals, or treats of the evolutionary aspects of zoological science. Various systems of classification have been framed by zoologists. Linnaeus divided the animal kingdom into six classes, viz. *Mammalia*, *Birds*, *Fishes*, *Amphibia*, *Insecta*, and *Worms* (Vermes). Cuvier proposed a more scientific arrangement. He divided the animal kingdom into four sub-kingdoms, viz. *Vertebrata*, *Mollusca*, *Articulata*, and *Radiata*. Recent classifications are more strictly based on morphological characters. Professor Huxley recognizes the following sub-kingdoms: *Vertebrata*, *Mollusca*, *Mollusca*, *Calentaria*, *Annulosa*, *Amulrida*, *Infusoria*, and *Protozoa*. See these terms.

**Zoomorphic** (zō-o-mor'fik), *a.* (Gr. *zōon*, a living being, an animal, and *morphe*, shape.) Pertaining to animal forms; exhibiting animal forms. Owing to their parts being more or less distinctly arranged round an axis he gave them the alternate name of *Radiata*. The term *zoophyte* is no longer employed by scientific naturalists. It is now loosely applied to many plant-like animals, as

sponges, corals, sea-anemones, sea-mats, and the like, the term *zoophytes* being synonymous with *Phytozoa*. See PHYTOZOA, 1.

taneously for a short time after being discharged from the spore-case of the parent plant. The motion is probably due to changes of hygroscopic or electric conditions, the purpose served being the wider diffusion of the seeds. **Electric, a.** [add.]—*Electric lamp*, the contrivance in which the electric light is produced. See *Electric light* below.—*Electric light*, a brilliant light, the result of heat produced by the force of electricity either evoked by the chemical reaction of a metal and an acid, or generated by a magneto-electric or other machine. The *arc light* is produced when two carbon pencils are attached to the electrodes of a powerful magneto-electric machine or galvanic battery, and their points are brought together long enough to establish the electric current. If they are then separated to a small distance, varying according to the strength of the current, the current will continue to flow, leaping across from carbon to carbon, emitting a light of great intensity at the space between the points. The name *Voltaic* or *electric arc* is given to that portion where the current leaps across from point to point, the term *arc* being suggested by the curved form which the current here takes. The *incandescence light* is obtained by the incandescence, by means of electricity, of various substances, including carbon, in a vacuum. Many forms of apparatus are in use for producing the electric light, distinguished either by the form of the generating machine, the distribution of the current, or the kind of burner. In the *Jablochhoff light*, the burner consists of a pair of carbon spindles placed parallel to one another, with an insulating earthy substance between them. Its combustion may be roughly compared to that of an ordinary candle, where the

earthy substance takes the place of the wick. Other forms of the 'candle' burners are in use, such as the Lontin, the Jamin, &c. The Maxim, Edison, and Swan lights proceed from an incandescent filament of carbon in a more or less perfect vacuum.—*Electric machine*, [add.] Besides machines in which electricity is excited by friction, electric machines are now common in which an electric current is generated by the revolution near the poles of a magnet or magnets of one or more soft-iron cores surrounded by coils of wire, these machines being known distinctively as *magneto-electric machines*. A *dynamo-electric machine* is a machine of this kind, in which the induced currents are made to circulate round the soft-iron magnet which produced them, thus increasing its magnetization. This again produces a proportionate increase in the induced currents, and thus by a successive alternation of mutual actions very intense magnetization and very powerful currents are speedily obtained. There are many forms of these machines, such as Gramme's, Siemens', Wilde's, Brush's, &c., used extensively in electric lighting, and as a motor for machinery, electric railways, &c.—*Electric pendulum*, a form of electroscopie consisting of a pith ball suspended by a non-conducting thread.—*Electric railway*, a railway on which electricity is the motor. Only short lines have as yet been constructed. On one of these the wheels of the carriages are set in motion by a dynamo-electric machine placed between them and below the floor. This machine is actuated by an electric current produced by another dynamo-electric machine, which is stationary and driven at a high rate of speed by a steam-engine. The current is conveyed by underground wires to the rails, and these being insulated, it reaches the carriage through them.

# PRONOUNCING VOCABULARY OF GREEK, LATIN, SCRIPTURAL, AND OTHER ANCIENT NAMES.

## RULES AND DIRECTIONS FOR PRONUNCIATION.

The pronunciation indicated in the following list is that usually heard from educated speakers of English, who as a rule do not attempt to pronounce Greek or Latin or Scriptural names in the way in which they were pronounced by the ancients themselves—if that could be with certainty determined—but rather seek to assimilate the pronunciation to that of their own language. There is therefore no great difficulty in the pronunciation of such words, and by attention to the following rules and directions any name in the list can be sounded correctly.

Special knowledge required for the right pronunciation of these words is—

1. The seat of accent; and
2. The sound to be given to the letters as they stand in the word.

The syllable of the word which is to receive the accent is denoted by the usual mark, an acute accent, placed immediately after it, as the first syllable of the word *Ca'to*, the second of the word *Cam-by'ses*, and the third of the word *San-cho-ni'a-thon*. The seat of the accent varies considerably in words of more than two syllables, though it is never on the last syllable; in dissyllables it is always on the first. The pronunciation of the latter, therefore, as also of monosyllabic words, after the following remarks are studied, will present no difficulty, and consequently many of them (especially those belonging to the classical languages) have been omitted from the list below. The division into separate syllables is denoted by the mark - as well as by the accentuation mark. Two vowels coming together in a word, but having one or other of these marks between them, must therefore always be pronounced as belonging to different syllables.

The sounds to be given to the several letters will be considered under two general heads, viz.: 1. The vowel letters; and 2. The consonant letters. It must always be borne in mind that silent letters, so common in English (*e* final for instance), are the exception in the words here treated of.

### I. THE VOWEL LETTERS.

The vowels heard in the words *fate*, *me*, *pine*, *note*, and *tube*, are called long vowels; while those heard in the words *fat*, *met*, *pin*, *not*, and *us*, are called short vowels.

1. When any of the vowel letters *a*, *e*, *i*, *o*, and *u*, constitute an accented syllable, and also when they end one, they are pronounced as long vowels; thus, in the first syllable of the words *Ca'to*, *Pe'lops*, *Di'do*, *So'lon*, and *Ju'ba*, they are pronounced as in the respective key-words *fate*, *me*, *pine*, *note*, and *tube*.

2. When the vowel letters are followed by one or more consonants in a syllable, they are pronounced as short vowels; thus, in the first syllable of the words *Cas'ca*, *Hec'u-ba*, *Cin'na*, *Cor'du-ba*, and *Pub'li-us*, they are pronounced as in the respective key-words *fat*, *met*, *pin*, *not*, and *us*.

3. When the letter *a* constitutes an unaccented syllable, as in *A-by'dos*, and when it ends one, as in *Ju'ba*, it is pronounced as *a* in *fat*.

4. The so-called diphthongs *æ*, *œ*, are always pronounced as the *e* of *me*, and are therefore simple vowel sounds, as in *Cæ'sar*, *Pæ'stum*, *Æ'o-lus*, *Bœ'o'ti-a*.

5. The digraph *ai* in a syllable is pronounced like *ai* in *wait*. It occurs only in Scriptural names. The *ai* of Greek words was pronounced like common English affirmative *ay*, or much the same as *i* in *pine*; but by the common spelling

it is Latinized into *æ*. An *æ* and an *i* coming together, but belonging to different syllables, will of course have either the accent or the mark - between them.

6. When *r* follows *a* in the same syllable, and is itself followed by a consonant, as in *Ar'go*, *Car-tha'go*, the *a* is pronounced as in *far*. In such a word as *Ar'a-dus* it is sounded as in *fat*.

7. The digraph *au*, as in *Clau'di-us*, *Au-fid'i-us*, is pronounced as *a* in *fall*. An *a* and a *u* coming together, however, may belong to different syllables, as in *Em-ma'us*.

8. When *e* constitutes an unaccented syllable, as in the first of the word *E-te'o-cles*, and when it ends one, as in *E-vad'ne*, it is pronounced as *e* of *me*. And when *e* is followed by *s* as the final letter of a word, as in *Her'mes*, *Ar-is-top'h'a-nes*, it is always pronounced as *e* of *me*.

9. When *e* is followed by *r* in the same syllable, as in *Her'mes*, *Mer-cu'ri-us*, the *e* is pronounced as *e* of *her*. The letters *i*, *u*, and *y*, before *r*, have the same sound, as in *Vir'gil*, *Bur'sa*, *Cyr'nus*. When *er* is followed by a vowel, however, *e* is sounded as in *met*, thus *Er'a-to*, *Mer'o-e*.

10. The digraph *ei*, as in *Plei'a-des*, is pronounced as *i* of *pine*. An *e* and *i* coming together, however, may belong to different syllables. Compare Rules 5 and 7.

11. The diphthong or digraph *eu*, as in *Leu-cip'pus*, *E-leu'sia*, *Ti-mo'theus*, is pronounced as *u* of *tube*. It occurs chiefly in Greek names. In other cases the *e* and *u* belong to separate syllables. Compare Rules 10 and 7.

12. When *i* constitutes the first and last syllables of words, whether accented or not, as in *I-be'ri-a*, *Fa'bi-i*, it is pronounced as *i* of *pine*. And *i* as the terminal vowel of a syllable at the end of words is also so pronounced, as in *Im'ri*, *A-ceph'a-li*.

13. But *i* at the end of any other unaccented syllable than the last, as in *In'di-a*, *Fa'bi-i*, is pronounced as *i* of *pin*.

14. In many cases *i* assumes the value of *y* consonant in English; thus *Aquileia* is pronounced as if *Aqui-le'ya*, *Caius* as if *Ca'yus*. This is especially common in the terminations of words.

15. *O* at the end of an unaccented syllable, as also when constituting an unaccented syllable by itself, is generally pronounced long or of medium length. Followed by *r* in the same syllable, as in *Gor'gus*, it is not usually pronounced long, but as *o* of *not*. The *o* in such a position is, however, by some speakers pronounced rather long than short, this being pretty much a matter of taste.

16. At the end of an unaccented syllable, or forming an unaccented syllable (as in *Æs'u-læ*, *A-bi'hu*), *u* is pronounced much the same as when accented, but shorter. Following *q* it is pronounced as *w*; thus the second syllable of *Equiculus* is pronounced exactly as the English word *quick*.

17. The letter *y* is pronounced as *i* would be in corresponding positions; thus the *y* in *Ty'a-na* is as *i* of *pine*; and the *y* in *Tyn'da-rus* as *i* of *pin*.

### II.—THE CONSONANT LETTERS.

The consonant letters, *b*, *d*, *f*, *h*, *j*, *k*, *l*, *m*, *n*, *p*, *q*, *r*, *t*, *y*, and *z*, have each but one sound, and as that is the English sound, they present no difficulty. The letters *c*, *g*, *s*, *t*, and *x*, have each more than one sound, and hence require rules to pronounce them aright.

1. *C* and *g* are hard, or sounded as in *call* and *gun* respectively, when immediately followed by the vowel letters *a*, *o*, and *u*, either in the same or in the following syllable, as in *Cas'ca*, *Cor-ne'li-a*, *Cur'ti-us*, *Hec'a-te*, *Hec'u-ba*, *Gal'lus*,

Gor'di-um, Au-gus'tus, Meg'a-ra, Teg'u-la. *C* and *g* are also hard immediately before other consonant letters, as in Clau-di-us, Cra'ssus, Ec-bat'a-na, Hec'tor, Glau'cus, Gra'vi-us, Bag-ra-da, Bo-du-ag-na'tus.

2. *C* and *g* are soft when immediately followed by the vowel letters *e*, *i*, and *y*, either in the same or in the following syllable, as in Cer-be-rus, Cin'na, Cy-re'ne, Cic'e-ro, Tic'i-da, Gel-li-us, Gis'co, Gy'as, Vo-log'e-ses, Um-brig'i-us. In words such as Dacia, Sicyon, Phocion, Accius, Glau'cia, Cap-pe-do'ci-a, the *ci* or *cy*, having the accent immediately before it, is often pronounced as *ski*: some authorities, however, retain the *s* sound in such words.

3. In Scriptural names, such as Megiddo, Gideon, *g* is always hard, except in the single word Bethphage. In consulting the list this will have to be kept in mind. The *s* following Scriptural names will serve as a guide.

4. When *c* and *g* are initial letters of a syllable, and immediately followed by *n* or by *t*, they are usually left silent in pronunciation; thus, Cneus is pronounced Ne'us; Gnidus, Ni'dus; and Ctenos, Te'nos. Some scholars, however, pronounce the *c* and *g* in these combinations; and should the reader elect to do so, he must pronounce them hard.

5. In Scripture names *k* often follows a vowel in the same syllable; as in Micah, Isaiah, Calneh, the vowel in these cases being pronounced with its short sound and the *k* being mute. In Greek names *rk* is equivalent to simple *r*.

6. The digraph *ch* is pronounced as *k*, thus, Achilles is pronounced A-kil'les; Chios, Ki'os; Enoch, E'nok. The Scripture name Rachel is the single exception to this rule, *ch* in it being sounded as in *chain*.

7. *S* as an initial of words is pronounced as *s* of the word *son*, as in So'lon, Spar'ta, Styx. It is commonly so pronounced as an initial of other than the first syllable of words, as in Su'sa, Si-sen'na; but in some exceptional cases the *s* receives the sound of *z*, as in the word Caesar, which is pronounced Cæ'zar. These exceptions will be denoted by the direction '*s* as *z*,' inclosed within parentheses, thus, Cæ'sar (*s* as *z*). See also rule 10.

8. *S* final of words, when preceded by *e*, is pronounced as *z*; thus Aristides is pronounced Ar-is-ti'dez. And the *e* so placed is that of the word *me* as remarked already. But when the final *s* is preceded by any other vowel, it is pronounced as *s* of *son*, as in Archytas, Amphipolia, Abydos, Adrastus.

9. *S* at the end of words, when preceded by a liquid, *l*, *m*, *n*, or *r*, is pronounced as *z*, as in Mars, which is pronounced Marz; Aruns, A'runz.

10. *Si* forming an unaccented syllable, preceded by an accented syllable with a final consonant, and followed by a vowel, is commonly pronounced *ski*; as in Al'si-um, Her-ten'si-us. When the *si* is preceded by a vowel it is very commonly pronounced as *zi*, as in Mo'si a, He'si-od, A-le'xi-a, Cæ'si-us; and sometimes as the *s* of *pleasure*, as in As-pa'si-a, The-o-do'si-a. But the usage in these cases is not very well settled, and some scholars carefully preserve the pure sound of the *s*, and do not even in such situations allow it to degenerate.

11. When *ti* followed by a vowel occurs next after the accented syllable of a word, it is pronounced as *st*; thus, Statius is pronounced Sta'sti-us; Helvetii, Hel-ve'sti-i; and similarly with Abantias, Actium, Maxentius, Laetius, &c. The proper sound of the *t* is preserved, however, when *ti* is accented or when it follows *s* or another *t*, as in Mil-ti-a-des, Sal-lus'ti-us, Brut'ti-i; so also in the termination -tion, as in A-e'ti-on. In such words as Domitius the *t* itself may be said to receive the *st* sound: Do-miash'i-us.

12. The digraph *th* is pronounced as *th* of the word *thin*, as in Tha-li'a.

13. *X* at the beginning of syllables is pronounced as *z*, thus, Xenophon is Zen'o-phon. But at the end of syllables it retains its voiceless sound of *k*, thus Oxi's is pronounced Oks'us. If, however, the *x* end a syllable which immediately precedes a vowel in the accented syllable, then the *x* receives its voiced sound, that of hard *g* followed by *z*, as in Alexarchus, which is pronounced Al-egz-ar'chus.

14. The letter *p*, when initial, and followed by *n* or by *t*, is not usually uttered, as in Pnigeus and Ptolemæus, which are pronounced Ni'geus and To'e-mæ-us, though some persons sound the *p*.

15. *Ph* represents the Greek character φ, and is pronounced as *f*; thus, Philippi is pronounced Fi-lip'pi. But when *ph* is followed by a consonant in the same syllable, as in Phthis, it is usually omitted in utterance, and the word is pronounced Thi'a. Some scholars, however, pronounce it.

16. *Ps* represents the Greek character ψ, which as an initial is pronounced as *s*, the *p* being generally omitted in utterance, as in Psyche, which is pronounced Sy'ke. Many scholars, however, now pronounce the *p* as well as the *s* of *ps*.

17. As a general rule, when any combinations of consonant letters which are difficult to utter occur at the initial part of words, the utterance of the first may be omitted, thus, Tmolus may be pronounced Mo'lus; Mnemosyne, Ne-mos'y-ne; while the digraph *ch* is dropped in Chthonia, making the pronunciation Tho'ni-a.

# PRONOUNCING VOCABULARY

## MODERN GEOGRAPHICAL NAMES.

### NOTES ON THE SPELLING AND PRONUNCIATION.

FOREIGN geographical names are spelled in English books either in the same manner as they are spelled in the language of the country to which they belong, or phonetically in accordance with the prevailing sounds of the letters of the English alphabet. The first method can, of course, be adopted only for names belonging to countries in which the Roman alphabet is used with or without diacritic marks. In the following notes on the pronunciation of foreign names the sounds indicated as those corresponding to the letters of foreign alphabets are explained, where necessary, by the key-line at the foot of the page.

In that key-line it will be seen that six signs are used to represent un-English sounds. These must be learned by the ear from those who are able to render them accurately, but it may be mentioned that the French sound heard long in *vê* and short in *bû* is like the sound of *u* in the Scotch word *abune*; that that heard long in *bleu* and short in *neuf* has some resemblance to the sound of *e* in *her*; that the sound represented by *ñ* (as in the French *on*) is produced by emitting voice through the mouth and nose at the same time, and is accordingly not a pure nasal (like the English *ng* in *sing*) but a semi-nasal; and that the *ch* in the German *nacht* is a strongly aspirated guttural like *ch* in the Scotch word *loch*. Strictly speaking two sounds are represented in German by *ch*, or by *g*, which is sometimes its equivalent. After the vowels *a*, *o*, *u* it is a guttural as in the Scotch *loch*, but after the other vowels and after consonants it is produced by the emission of breath between the point of the tongue and the fore-part of the palate.

Even with these signs for un-English sounds it must be remembered that the sound indicated for the letters of foreign alphabets is very often only an approximation to the true pronunciation, as foreign languages have a great many shades of sound which can be acquired only by those who have familiarized themselves with these languages as they are actually spoken by the people, and which, besides, no Englishman would ever think of trying to reproduce in pronouncing foreign names while reading or speaking English. It will be observed that, as the key shows, *y* is always used with its consonantal or semi-vowel sound as in *yes*. Thus when it is stated that the Hungarian *gy* has the sound of *dy*, it is to be understood that at the end of a word that combination does not form a separate syllable, but goes to form one syllable with the preceding letters. The Hungarian prefix *Nagy*, for example, is pronounced in one syllable *Nody*, the *d* being followed by the consonant *y* with an effect closely resembling that of a very soft *zh*.

A. Some rules for the pronunciation of languages using the Roman alphabet.

#### VOWELS AND VOWEL DIGRAPHS.

*a* is usually sounded *ä*, but sometimes long sometimes short. In Hungarian it is sometimes like *o* in *not*.  
*å* in Swedish is sounded *ö*.  
*ä* or *ae* is usually sounded like *ä* or *e*, in Flemish (and old Dutch) like *ä*.  
*ą* in Polish is sounded like the French *on*.  
*aa* in Danish is sounded as *ö*, in Dutch as *ä*.  
*ai* and *ay* usually have each of the vowels sounded, the sound of *ä* being rapidly followed by that of *é*. In

German they are sounded like *i* in *pine*, in French mostly like *ä*.

*ão* in Portuguese is sounded as *ouñ*.

*au* is usually pronounced either with the sounds of the vowels separately, or as a diphthong like *ou*. In French it is pronounced like *o* in *note*.

*e* is usually sounded like *ä* or *e* in *met*. In Spanish it always has the latter sound. Very often it has an obscure sound as in the English *golden*. In French it is often mute.

*ę* in Polish is sounded like the French *ain* (*añ*).

*ě* in Bohemian and Servian is sounded as *ye* or *yä*.

*eau* in French has the sound of *o* in *note*.

*ei* and *ey*, like *ai* and *ay*, usually have each of the vowels sounded separately, the sound of *ä* being rapidly followed by that of *é*. In Dutch and German they have the sound of *i*. In French they are pronounced like *ä* or *e*.

*eu* is sounded in Dutch as in French, in German like *oi*, in other languages with the sounds of the vowels separately.

*i* is usually sounded like *é*, or, when short, often like *i*.

*ie* in Dutch, German, and French is sounded like *é* except where the letters belong to two syllables.

*ij* in Dutch has a sound like that of *i* in *pine*, but more open, that is, with less of the *é*-sound at the close.

*o* is usually sounded like *ö* or *o*, in Danish and Norwegian sometimes like *ö*.

*ö* or *oe* is sounded in German, Danish, and Swedish like *eu* in French.

*ø* in Danish has a sound similar to *ö*, but somewhat closer.

*ó* in Polish is sounded like *o* in *more*.

*oi* is usually pronounced with the sounds of the separate vowels, in French it is like *wa* in *war*.

*ou* in French has the sound of *ö*, in Dutch and Norwegian that of *ou*.

*u* is usually sounded as *ö* or *u*; in French, as already mentioned, the sound is peculiar. In Danish, when short, it is sounded like *é*; in Dutch, when short and followed by a consonant in the same syllable, like *u*; when long, like *ü*; in Welsh, without an accent mark, like *i*.

*ü* or *ue* in German is sounded like *ü* or *ü*.

*û* in Welsh is sounded like *ä*.

*ui* in Dutch is pronounced like *oi* in *oil*.

*y* is usually sounded like *é*; in Danish, Swedish, and Polish like the French *u*. In old Dutch it is used where the digraph *ij* is used in modern orthography. In Welsh, without an accent mark, it has the sound of *u*, except at the end of a word when it sounds like *i*.

*ŷ* in Welsh has the sound of *e* in *me* (like the Welsh *û*).

#### CONSONANTS AND CONSONANTAL DIGRAPHS.

Most of the consonants have the same sound in the languages of the European continent using the Roman alphabet as they have in English, but the following peculiarities are to be noted:—

*b* at the end of a word is often sounded in German like *p*. In Spanish it is pronounced with very feeble contact of the lips so as to be softened almost to a *v*-sound.

*c* before another consonant and before the vowels *a*, *o*, *u* is usually sounded like *k*; in French, Danish, Swedish, and Portuguese it is sounded in other situations like *s*, in Italian like *ch* in *chain*, in Spanish like *th* in *thin*,

Fäte, fär, fat, fäll; j, job;	mä, met, hér, golden; yh, then; th, thän;	pine, pín; zh, azure.	nôte, not, möve; French, vûe, bû;	tub, bull; bleû, neuf;	oil, pound; h, on.	ch, chäsh; German, ch, nacht.	g, go;
----------------------------------	--	--------------------------	--------------------------------------	---------------------------	-----------------------	----------------------------------	--------

in German like *ts*. In Italian where another vowel follows *ci* (as well as *gi* or *sci*) the *i* is not sounded. In Spanish America *c* is usually pronounced as *s* in those cases in which in Spain it is pronounced *th*. In Bohemian and Polish it is always sounded like *ts*, and in Welsh always like *k*.

*ç* is used in French and Portuguese to indicate the *s*-sound of *c* before the vowels *a*, *o*, and *u*.

*ch* in Dutch, Polish, and Bohemian, as well as in German, has the sound of *ch*; in Italian it has the sound of *k*; in French (except in some words derived from the Greek, in which it is sounded like *k*) that of *sh*.

*cs* in Hungarian has the sound of *ch* in *chain*.

*cz* in Polish has the sound of *ch* in *chain*, in Hungarian that of *ts*.

*d* at the end of a word in German and Dutch is often sounded like *t*. In Spanish and Danish between two vowels, and after a vowel at the end of a word, it is softened to the sound of *th*, and in the latter language the same sound is given to it even when doubled. Strictly speaking the Spanish *d* is a dental *d*, being sounded by placing the tip of the tongue close to the lower edge of the upper front teeth. At the beginning of a sentence and when the *d* is preceded by another consonant, whether in the same word or another, the tongue is more firmly pressed against the teeth and a sound like that of the English *d* is produced, but in other cases the contact is so slight as to produce a sound almost exactly like that of *th*. At the end of words even this sound is almost inaudible. When *d* comes after *l*, *n*, *r* in Danish it is not sounded at all, and it is still more frequently silent in the Norwegian pronunciation of the language.

*dd* in Welsh has the sound of *th*.

*dz* in Polish is sounded like *zy*.

*g* before a consonant and before the vowels *a*, *o*, and *u* mostly has the sound of *g* in *go*; and it has the same sound before other vowels also in German and Danish, and in all situations in Polish and Welsh. After a vowel it frequently has in German and Danish a guttural sound, and in the Norwegian pronunciation of the latter language it is often silent in that situation. In Dutch it is always a deep guttural, except in the combinations *gh* and *ng*, the former of which is pronounced like *g* in *go*, the latter like *ng* in *sing*. In French, Portuguese, Spanish, and Swedish it has the sound of the *j* of the same languages in all situations in which it has not the sound of *g* in *go*, and in Italian it is then sounded like our *j*. (See above under *c*.)

*gh* in Italian and Dutch has the sound of *g* in *go*.

*gl* in Italian has the sound of *ly*.

*gn* in French and Italian has the sound of *ny*.

*gu* in French always, and in Portuguese and Spanish before *e* and *i*, has the sound of *g* in *go*.

*gy* in Hungarian has the sound of *dy* or *dzh*.

*h* in French, Italian, Spanish, and Portuguese is silent or scarcely audible. In Spanish it is heard as a slight aspiration before the combination *ue*. In Danish it is not sounded before *j* and *v*.

*j* in most languages has the sound of *y*, in French and Portuguese that of *zh*, in Spanish that of *ch*. In Danish the sound of the Danish *j* (that is, the sound of the consonant *y*) is always interpolated after the consonants *k* and *g* before the vowels *æ*, *ö*, *ø*, *y*, and *i*. In Hungarian at the end of a syllable *j* has the sound of *e* in *me*.

*k* in Norwegian before *e*, *i*, *j*, *y*, and the modifications of *a* and *o*, is sounded like *ty*.

*†* represents in Polish a sound peculiar to that language and Russian. It is produced by attempting to sound an *l* with the point of the tongue directed further back in the palate than for the ordinary *l*, and with very slight contact between the tongue and palate.

*lh* in Portuguese has the sound of *ly* (Ital. *gl*).

*ll* in French in formal speech has the sound of *ly*, but colloquially is generally sounded like the consonant *y* without any *l*-sound. In Spain it always has the former sound, but in Mexico the latter is often substituted. In Welsh it has a peculiar sound, which is approximately rendered when one attempts to pronounce *tl* at the beginning of a syllable.

*m* in French and Portuguese often has the sound of *n*. See preliminary remarks.

*ñ* in Spanish

*ń* in Polish

*ň* in Bohemian

*nh* in Portuguese

*qu* in French always, and in Portuguese and Spanish before *e* and *i*, is sounded like *k*.

*r* is almost always more strongly trilled than in English.

*ř* in Bohemian

*rz* in Polish

*s* in German is usually pronounced soft, like English

*z*, at the beginning of a word where a vowel follows; in Hungarian it is sounded as *sh*.

*ś* in Polish has the sound of *sy*.

*sc* in Italian before *e* and *i* has the sound of *sh*. (See above under *c*.)

*sch* in German has the sound of *sh*, but in Dutch and Italian has that of *s* followed by the respective sounds of *ch*, in Dutch accordingly it is equivalent to *sch*, in Italian to *sk*.

*sk* before *e*, *i*, *j*, *y*, and the modifications of *a* and *o* is sounded in Norwegian like *sh*.

*stj* in Swedish when followed by a vowel has the sound of *sh*.

*sz* in Polish

*š* in Bohemian

*sz* in Hungarian is sounded like *s*.

*t* in Spanish is dental like the Spanish *d*.

*th* in Welsh is sounded like *th* in *thin*, in all other European languages using the Roman alphabet like the simple *t*.

*tj* in Swedish when followed by a vowel has the sound of *ch* in *chain*.

*ts* in Hungarian is sounded like *ch* in *chain*.

*w* in German and Dutch has a sound closely resembling that of *v* produced by bringing the lips feebly into contact, not by placing the upper teeth against the lower lip. In Welsh it has the sound of *y* or *ö*.

*x* in Portuguese has the sound of *sh*; in old Spanish spelling it is used where *j* is now used to represent the sound of *ch*.

*y* is usually a vowel, but in Spanish it has also a consonantal sound like the English *y*, and the same sound is heard in Hungarian after *d*, *g*, *l*, *n*, and *t*.

*z* in German and Swedish has the sound of *ts*, in Italian sometimes that of *dz* sometimes that of *ts*, in Spanish that of *th* in *thin*. In Spanish America this *th*-sound usually gives place, like the *th*-sound of *c*, to that of *s* in *sing*.

*ż* in Polish has the sound of *zy*.

*ž* in Polish

*ž* in Bohemian and Servian

*zs* in Hungarian

**B. Hints on the pronunciation of geographical names belonging to languages not using the Roman alphabet.**

The general rule regarding the spelling of such names is to spell them in English phonetically in accordance with the prevailing sounds of the letters of the English alphabet. In such phonetic spellings, however, the vowels usually receive their continental sounds (as in *far*, *rein*, *pique*, *rule*). In Indian and some other Asiatic names and in Arabic names *a* is often used also to represent the sound of the English *u* in *but*. The vowel digraph *ai* usually represents the sound of *y* in *fly*, but sometimes (as in all Greek names) that of *a* in *fate*; *ei* most commonly that of *a* in *fate*, but sometimes that of *y* in *fly*; *au* for the most part sounds as *ow* in *now*, but in some cases as *a* in *fall*. In the spelling of Indian names this last digraph is often used where *ai* is now mostly used, the sound intended being that of *a* in *far*, or perhaps one somewhat broader. The consonants *j*, *w*, *y*, *z* have as a rule their characteristic English sounds, as in *jet*, *yet*, *well*, *zeal*; *g* usually has its hard sound as in *get*. *Ch* usually represents the sound which it has in *chain*; *gh* sometimes that of a very rough aspirate, sometimes a sound like that of the Northumberland or Berwickshire burr, sometimes, before *e* or *i*, merely the

hard sound of *g*; *kh* is the combination most frequently used to represent the sound of *ch*; and *th* usually stands for the sound which it has in *thin*, sometimes for that which it has in *then*.

In the spelling of geographical names belonging to languages which do not use the Roman alphabet (as also of those which were first put in writing by Europeans) numerous variations are found from different causes, and it will throw some light on the pronunciation to note what the principal causes of these variations are.

1. Very often the variation is due to the irregularity in the use of our own alphabet, which leads one person to represent the same sound phonetically in one way, another in another. From this cause *s* and *z* are frequently interchanged, as in *Kasan*, *Kazan*; so also are *oo*, *ou*, and *u*, where the sound of *u* in *bull* or in *rule* is intended, as in *Moorzook*, *Mourzouk*, *Murzuk*, &c.; and so also are *i* and *y*, as in *Ustyansk*, *Ustiansk*; *Krasnoyarsk*, *Krasnoiarsk*. Hence likewise those names which are spelled with *a* to represent the sound of *u* in *but*, are also frequently found spelled with *u*, as in *Panjab*, *Punjab*.

2. Sometimes the variation is due to the obscurity of the sounds themselves, as where a vowel sound is so short that its exact quality can hardly be determined, as in *Bedouin*, *Bedawin*; or where a short vowel sound seems to one ear to make a separate syllable, while to another ear no such syllable seems to be heard, as in *Bassora*, *Basra*; *Wargela*, *Wargla*.

3. In other cases the variation is due to the adoption in English of a continental mode of spelling, as where *dj* is adopted from the French for *j*, as in *Djebel* for *Jebel*, or *tch* from the same language for *ch*, as in *Nertchinsk* for *Nerchinsk*, *Kamtchatka* (the common spelling) for *Kamchatka*, or *j* from the practice of most continental nations for *y*, as in *Jakutsk* for *Yakutsk*.

When the variation in spelling is due to any of these causes, a comparison of the different forms of the name will often serve as a good indication of the correct pronunciation, where any one of them might leave it doubtful; for the correct pronunciation must be more or less consistent with all the different forms. Thus when *Bassora* is also found spelled *Basra* it is clear that the correct pronunciation cannot be *Basso'ra*, and when *Bedouin* is found spelled also *Bedawin*, *Bedaween*, &c., it shows that the accents lie on the first and third syllables, and that the *i* in *Bedouin* is pronounced as *e* in *me*.

4. Other variations are due to the fact that the sounds to be represented have no signs for them in the Roman alphabet or any of its commonly used digraphs, so that different signs are adopted to represent them approximately in accordance with the conceptions of different persons. One of the chief instances of this sort is a sound existing in Arabic and Hindu resembling the Northumbrian burr. Usually this sound is represented by *gh*, but in the case of many Arabic names in North Africa it is often represented by *rh* or *r*. Thus *Ghadames* is often spelled *Rhadames*, the tribe of the *Songhay* often *Sonrhay*.

5. In other cases the variation is accounted for by differences of dialect, or different pronunciations of the same dialect in different parts of the country or region in which a particular language is spoken. In this way arise many of the varieties of spelling in Chinese, Indian, and Arabic names. In the last one of the most notable dialectal peculiarities of pronunciation is in the case of the Arab character usually sounded as *j*, but in some parts, as in *Egypt*, as *g* in *get*. For this reason the Arabic *Jebel* (mountain) is usually spelled in Egyptian names *Gebel*, in which *g* is intended to have its hard and not its soft sound.

6. Another cause of variation is the fact that the strict rule of phonetic spelling is sometimes departed from, and the English form of a name is partly accommodated to the spelling of the language to which it belongs, the same letter in that language being always represented by the same in English, even though the pronunciation may vary in the original language. This is frequent in Russian names, in which the sounds of *v* and *f*, those of *a* and *o*, &c., are often represented by the same letter,

and in which the Russian character representing the sound of *a* in *fate* or *e* in *met* sometimes stands for the same sound preceded by that of the consonant *y*. In this way are explained such variations as *Kief*, *Kiev*; *Semipolatsinsk*, *Semipalatinsk*; *Semiryechensk*, *Semirechensk*.

7. Lastly, the foreign spelling of a name is sometimes adopted for native names in regions out of Europe belonging politically to European powers. Thus *Sourabaya* may sometimes be seen spelled in the Dutch fashion, *Soerabaja*. In Spanish and Portuguese America this is done almost uniformly.

In Chinese the digraph *ao* represents the sound of *a* in *far* gliding into that of *o*, the whole sound closely resembling that of *ow* in *now*; *ei* represents the sound of *a* in *fate* gliding into a very short *ē*-sound (as in *me*); in *ia*, *ie*, *iu* the sounds of *a*, *e*, *u* are preceded by a very short *i*-sound, a sound almost identical with that of the consonant *y*; *oo* (for which *u* is often used) usually represents the sound of *u* in *bull* or in *rule*, but sometimes it represents a long *o* gliding into a very short sound like that of *u* in *bull*. When *o* precedes *a* or *ei* it is sounded very short so as to be almost equivalent to the consonant *w*; hence we have such spellings as *Whangho* (or *Hwangho*) and *Kweichoo* or *Queichoo*, as well as *Hoangho* and *Koeichoo*. The initial *ng* is a nasal, as in the word *sing* (not as in *finger*), and this initial sound is also met with in names belonging to the other monosyllabic languages of Eastern Asia, as well as in some African and New Zealand names.

In Indian, Arabic, and some other names aspirated consonants occur, and are represented in spelling by an *h* following the consonant, as in *Bhāgalpur*. The proper sound of this combination is accurately represented by the letters composing it, but in the English pronunciation of such names this peculiarity is commonly disregarded.

In African words the consonant *m* used as a prefix has a shortened sound of *um*, and in the South African colonies this prefix is so spelled, as in *Umtata*, *Umtzila*, &c. By travellers in equatorial Africa, however, the simple *m* is always used, as in *Mpwapwa*. Except at the end of a word *y* is always the consonant. Lake *Nyassa*, for example, is to be pronounced as two syllables, *Nyas'sa*, not in three as *Ni-as'sa*.

For the spelling of Maori names in New Zealand the Roman alphabet was introduced by the English missionaries, but only fourteen characters are required, namely, *a*, *e*, *h*, *i*, *k*, *m*, *n*, *o*, *p*, *r*, *t*, *u*, *w*, and the nasal *ng*. The vowels have the continental sounds, and are always sounded separately, never coalescing into a proper diphthong.

In the following list showing the pronunciation of geographical names the only diacritic marks which are used are the acute, grave, and circumflex accents ( ' ^ ^ ), the modification mark ( " ), the cedilla ( ¸ ), and the tilde ( ~ ); and it will be understood that, where the respelling of a name indicates the pronunciation of a diacritically marked letter not so marked in the name as given in the list, that name is spelled with a letter so marked in the language of the country to which it belongs. Thus, when it is stated that the Swedish name *Tornea* is pronounced *tor-nā-ō*, it may be inferred, in accordance with the rules just given, that in Swedish that name is spelled *Torneå*. In respelling names to indicate pronunciation the consonants, *b*, *d*, *f*, *h*, *j*, *k*, *l*, *m*, *n*, *p*, *r*, *t*, *v*, and *z*, and the digraphs *ng*, *nk*, and *sh* always have their usual English sounds, and *s* always has the hissing sound as in *sea*. The key-line gives the explanation of the other signs.

Note.—In consulting this List it should be kept in mind that attention to the preceding notes indicating the variations that may be looked for in the spelling of foreign names will often be of assistance to those doing so in finding the name they are in search of, since names not found under one spelling may be found under some other equivalent spelling. Thus many names not found spelled with *c*, *ch*, *z*, *y*, &c., may be found under the spellings *k*, *kh*, *s*, *j*, &c. respectively; Spanish names in *x* may be found spelled with *j*, Dutch names in *y* may be found in *ij*, German, Danish, and other names in *ae* or *oe* may be found in *ä* (sometimes *e*) or *ö*; and so forth.

*j*, job; *y*, yes; *th*, then; *th*, thin; *zh*, azure. French, *vûe*, bût; *bleû*, neûf; *h*, on German, *ch*, nacht.
